The guidance provided in this Actuarial Guideline concerning statutory minimum formula reserves for equity indexed annuity products supersedes the valuation guidance in Sections 5 and 6 of the NAIC Interest-Indexed Annuity Contracts Model Regulation.

Asset Adequacy Testing of Reserves

To the extent required by law, regulation, or regulatory requirements, reserves established for equity indexed annuity policies must be tested for adequacy using appropriate methods and assumptions.

Not for Distribution

ATTACHMENT 1 Description of Computational Methods

CARVM-UMV

Step 1: For each duration and each benefit at which an index-based benefit is available, determine the market value of the appropriate call option. The appropriate call option is one that exactly hedges the floor of the benefit at that point in time. This means that the payoff of the call option should exactly equal the difference between the specific benefit available at that point in time (reflecting all relevant contract features) and the guaranteed floor of that benefit. The market value should be determined using an appropriate option pricing technique, such as Black-Scholes or a stochastic scenario method.

Step 2: The market value of all of the call options are projected forward at the appropriate valuation interest rate to the point in time at which the call option would expire. The valuation interest rate should be consistent with the requirements of any applicable Actuarial Guidelines or regulations, such as Actuarial Guideline XXXIII or Actuarial Guideline IX-B.

Step 3: The future guaranteed benefits for each benefit at each time point are determined by adding the guaranteed floors of the benefit to the amounts determined in Step 2.

Step 4: Now a CARVM calculation can be performed. The CARVM calculation should be in accordance with Actuarial Guideline XXXIII and any other applicable regulations or Actuarial Guidelines.

MVRM

Step 1: Calculate the projected index value at the end of the “term” which would produce a benefit at the end of the “term” equal to the sum of (1) the contract guarantee at that time, and (2) the current market value of the call option(s) which would fully hedge the index-based benefit, accumulated at the appropriate valuation interest rate. This calculation should be performed assuming equal annual percentage increases in the index. The call options used are those with maturity dates coterminous with the setting of participation rates, spread, or any other method of determining index-based benefits. The valuation interest rate used to accumulate the call options should be consistent with the requirements of any applicable Actuarial Guidelines or regulations, such as Actuarial Guideline XXXIII or Actuarial Guideline IX-B. Note that the “term” referred to above should be consistent with the “term” described in this Actuarial Guideline.

Step 2: From the current level of the index and the projected level of the index at the end of the term, calculate an implied compound constant growth rate of the index from the valuation date to the end of the term. Use this implied growth rate to project the level of the index at intermediate anniversaries.

Step 3: All annuity benefits can now be determined from the index levels.

Step 4: Now a CARVM calculation can be performed. The CARVM calculation should be in accordance with Actuarial Guideline XXXIII and any other applicable regulations or Actuarial Guidelines.

MVRM Using Black-Scholes Projection Method

This is an adaptation of the basic MVRM approach to accommodate products for which the participation rate, spread, or any other benefit determination method is redetermined during the term (particularly annually).

Step 1: Calculate the cost of a full hedging call option as a percentage of the account value for the period that the benefit determination is guaranteed, accumulate the percentage to the end of that period at the risk-free interest rate, and use the accumulated percentage cost as the projected growth rate of the account value during the period. Perform the same type of calculation for each successive period within the term,

giving recognition to the benefit guarantees, forward interest rates, forward index volatility, and index dividend levels.

Step 2: Determine the index level which would provide the projected account level on each anniversary on the basis of the participation rate, spread, or other benefit determination method used.

Step 3: All annuity benefits can now be determined from the index levels.

Step 4: Now a CARVM calculation can be performed. The CARVM calculation should be in accordance with Actuarial Guideline XXXIII and any other applicable regulations or Actuarial Guidelines.

EDIM

Step 1: The Fixed Component at issue is the formula reserve produced by either CARVM-UMV or MVRM. The Fixed Component at the end of the term is the floor of the benefit actually being hedged.

Step 2: The intermediate values of the Fixed Component are found by solving for an interest rate that would accumulate the initial value to the ending value. For example, assume you purchase options assuming that 90% of policyholders will surrender at maturity, and that 10% of policyholders will annuitize at maturity. The Fixed Component is the sum of (1) 90% of the Fixed Component that grows to the floor of the surrender benefit; and (2) 10% of the Fixed Component that grows to the floor of the annuitization benefit.

Step 3: The Equity Component is equal to the discounted intrinsic value of the options. The discounted intrinsic value of the options is found by taking the intrinsic value at the valuation date, and discounting at the valuation rate for the number of years from the valuation date to the end of the term. The valuation interest rate used to discount the intrinsic value of the call options should be consistent with the requirements of any applicable Actuarial Guidelines or regulations, such as Actuarial Guideline XXXIII or Actuarial Guideline IX-B.

Step 4: The reserve is the sum of a Fixed Component and an Equity Component.

Not for Distribution

ATTACHMENT 2 Hedged as Required Criteria

In order to use a Type 1 computational method, the appointed actuary needs to certify quarterly that it meets either the “Basic” or “Option Replication” criteria.

Basic

1. Required equivalence of characteristics between the option contracts held and the options imbedded in the products with respect to specific contract features such as: Index, averaging features, option type, strike price, term, etc.
2. The amount of hedge purchased, at or near the contract issuance, must be greater than or equal to a Specified Percentage of the product’s account value, at contract issuance. The Specified Percentage varies by the length of the option guarantee (some annual ratchet products may have a term of several years, but the participation rates are only guaranteed for one year, so the “term” for this purpose is 1 year), and allows the company to assume no more than 3% per year of elective benefit decrements, unless the Commissioner agrees to a higher limit. For example, for a five-year point-to-point product, the Specified Percentage would be: $SP\% = (1 - .03)^5 = 86\%$.
3. The Company must have a specific plan for hedging risks associated with interim death benefits, early surrenders, etc.
4. The Company must have a system in place that is used to monitor the effectiveness of the company’s hedging strategy.
5. The Company must have a stated maximum tolerance for differences between the expected performance of the hedge and the actual results of the hedge.

Option Replication

1. Required equivalence of characteristics between the target of an option replication strategy employed, and the options imbedded in the liabilities with respect to specific contract features such as: index, averaging features, option type, strike price, term, etc.
2. At the end of each quarter, the notional amount of the target of the option replication strategy must be greater than or equal to the sum of the Specified Percentages of each contract's account value. The Specified Percentage varies by the length of the remaining option guarantee (some annual ratchet products may have a term of several years, but the participation rates are only guaranteed for one year, so the “term” for this purpose is 1 year), and allows the company to assume no more than 3% per year of elective benefit decrements, unless the Commissioner agrees to a higher limit. For example, if a point-to-point contract has five years remaining, the Specified Percentage for that contract would be: $SP\% = (1 - .03)^5 = 86\%$. Appropriate assumptions for non-elective decrements such as mortality may be added to the assumption for elective decrements.
3. The company must have a specific plan for hedging risks associated with interim death benefits, early surrenders, etc.
4. The Company must have system in place that is used to monitor the effectiveness of the company’s hedging strategy.
5. The Company must have a stated maximum tolerance for differences between the expected performance of the hedge and the actual results of the hedge. The maximum tolerance test and compliance evaluation test must meet the following minimum requirements. The compliance evaluation criteria will be a retrospective correlation test performed at least on a weekly basis.

The Company will compare the change in the market value, from the beginning of the calendar quarter, of the hedge portfolio with the change in the market value of the options embedded in the liability portfolio. The maximum dollar amount of difference permitted between these two changes is 10% of the beginning of period market value of the options embedded in the liabilities. If the difference exceeds this limit, the following steps must be taken:

- If for a second time during a quarter the dollar amount of difference exceeds 10% of the beginning of period market value of the options embedded in the liabilities, but is less than 25% of the beginning of period market value of the options embedded in the liabilities, the Company must notify the Commissioner of Insurance in each state in which the insurer is licensed. The notification must indicate the dollar amount of reserves being hedged by the option replication strategy.
- If at any of the weekly intervals, the difference between the two changes exceeds 25% of the beginning of period market value of the options embedded in the liabilities, the Company must notify the Commissioner of Insurance in each state in which the insurer is licensed. The notification must indicate the dollar amount of reserves being hedged by the option replication strategy and the impact on surplus of reporting the reserves based on the CARVM-UMV.
- If at any point in time during the quarter the difference between the two changes exceeds 35% of the beginning of period market value of options embedded in the liabilities, the insurer is deemed to be out of compliance with the "Hedged as Required" criteria, and the Company must notify the Commissioner of Insurance in each state in which the insurer is licensed. The notification must indicate the dollar amount of reserves being hedged by the option replication strategy and the impact on surplus of reporting the reserves based on the CARVM-UMV.

Drafting Note: The requirements discussed above deal with the situation in which the actual hedge underperforms relative to the expected hedge performance. The ability of an insurer to over-hedge may be constrained by other components of a state's regulatory framework including the state's investment article and regulations concerning the use of derivative instruments. For purposes of this Drafting Note, over-hedged means that at a particular point in time, the hedge portfolio exceeds the portfolio of liabilities being hedged. If over-hedged, the excess hedging instruments are excluded from the measurements required in Item 5 of the Hedged as Required Criteria.

ATTACHMENT 3
Reasonableness of Assumptions Certification

The following certification must be filed in conjunction with each quarterly and annual statutory financial statement filed with the appropriate regulatory official in each state in which the insurer does business. The certification must be signed by the appointed actuary.

I, (state name and professional designation), am the appointed actuary for (company name). I have reviewed the assumptions underlying the values assigned to all equity options used in the determination of the initial statutory reserves under the Enhanced Discounted Intrinsic Method for all equity indexed deferred annuity products issued or reinsured by (company name) and reported in the statutory financial statement as of (the date of valuation). The assumptions used to determine such option market values are reasonable in light of the relevant economic conditions prevalent at the time of issue of each policy valued using the Enhanced Discounted Intrinsic Method.

(Name of actuary)

(Signature of actuary)

(Date of certification)

ATTACHMENT 4**Reasonableness and Consistency of Assumptions Certification**

The following certification must be filed in conjunction with each quarterly and annual statutory financial statement filed with the appropriate regulatory official in each state in which the insurer does business. The certification must be signed by the appointed actuary.

I, (state name and professional designation), am the appointed actuary for (company name). I have reviewed the assumptions underlying the values assigned to all equity options used in the determination of statutory reserves for all equity indexed annuity products issued or reinsured by (company name) insurance company and reported in the statutory financial statement as of (the date of valuation). The assumptions used to determine such option market values are:

1. reasonable in light of current relevant economic conditions as of the date of valuation, and
2. are consistent with the comparable assumptions used to determine the statement value of any derivative instruments used to hedge the equity indexed based obligations embedded in the equity indexed annuities subject to this certification.

(Name of actuary)

Actuarial Guideline XXXVI

THE APPLICATION OF THE COMMISSIONERS RESERVE VALUATION METHOD TO EQUITY INDEXED LIFE INSURANCE POLICIES

Background

The purpose of this Actuarial Guideline is to clarify statutory and regulatory requirements for the valuation of reserves for equity indexed universal life insurance policies. This Guideline codifies the interpretation of the Commissioners Reserve Valuation Method (CRVM) by clarifying the computational methodologies that are deemed to comply with the intent of the Standard Valuation Law (SVL) and the Universal Life Insurance Model Regulation. These methodologies will be deemed to be consistent with CRVM.

Equity indexed universal life insurance policies include interest credits that are a combination of a guaranteed interest rate and an interest rate based on a percentage of the increase in an equity index, such as the S&P 500. Currently, there are only a few products in the market and the product designs have been straightforward. As new product designs emerge, this Actuarial Guideline may have to be revised.

In order that all insurers issuing equity indexed universal life insurance policies establish reserves for statutory reporting purposes that are consistent with CRVM minimum statutory formula reserves, this Actuarial Guideline identifies a computational method deemed to be consistent when specific operational criteria called “Hedged as Required” criteria are met. In addition, two other computational methods are defined that are deemed to be consistent with CRVM in the event the “Hedged as Required” criteria are not met.

Scope

This Actuarial Guideline applies to all equity indexed universal life insurance policies, regardless of the date of issue, that are subject to CRVM and would otherwise be subject to the reserve requirements under the Universal Life Insurance Model Regulation.

Definitions

Appointed Actuary. The appointed actuary, for purposes of this guideline, is the actuary appointed by the company’s board of directors to provide opinions in accordance with Standard Valuation Law and the model Actuarial Opinion and Memorandum regulation.

Credited. Index-based benefits will be considered to be credited when they are added to the fund and treated in the same manner as other interest credits to the fund.

Term. An index-based benefit crediting period.

Computational Methods

Computational methods deemed to be consistent with CRVM can be classified into three groups, Type 1 methods, Type 2a methods and Type 2 methods. The following computational method is considered a Type 1 method: the Implied Guarantee Rate Method (IGRM). Type 1 computational methods are deemed to be consistent with CRVM only if the “Hedged as Required” criteria are met. The following is considered a Type 2a method: the Commissioners Reserve Valuation Method with Updated Average Market Value (CRVM with UAMV). The following is considered a Type 2 method: the Commissioners Reserve Valuation Method with Updated Market Value (CRVM with UMV). For a complete description of these methods, consult Attachment 1.

The minimum reserve for equity indexed life insurance policies is the statutory reserve calculated under the Universal Life Insurance Model Regulation for an identical policy with no guaranteed index-based benefits. If the reserve produced by Type 1, Type 2a or Type 2, as appropriate, is greater than the minimum reserve, then that Type 1, Type 2a or Type 2 reserve is the minimum reserve.

Type 1 Methods

A Type 1 computational method is deemed to be consistent with CRVM if an insurer using the method complies with the “Hedged as Required” Criteria (Attachment 2) and provides a certification (Attachment 3) as to compliance with the criteria. The appointed actuary must sign the certification. The certification shall be provided with each annual and quarterly statutory financial statement filed with the appropriate insurance regulatory official in each state in which the insurer writes or reinsures equity indexed universal life insurance business.

For purposes of determining compliance with the “equivalence of characteristics” requirement in the “Hedged as Required” criteria, the current term of an equity indexed universal life insurance policy is one year or less. This should be interpreted consistently when a separate index-based benefit guarantee is made on each premium received.

The IGRM computational method is deemed to be consistent with CRVM under the following conditions:

1. The implied guaranteed rate for terms after the first, determined at issue using the method of Attachment 1, paragraph 3 of the IGRM method, is less than or equal to the appropriate maximum valuation interest rate.
2. Index-based benefit terms cannot be greater than one year. This should be interpreted consistently when a separate index-based benefit guarantee is made on each premium received.
3. The appointed actuary has demonstrated at time of filing or in conjunction with a change to a Type 1 Method, to the satisfaction of the regulatory officials in each state in which the insurer writes or reinsures equity indexed universal life insurance business, prior to the use of the IGRM that the requirements in (1) and (2) above have been met.

Type 2a Methods

A Type 2a computational method is deemed to be consistent with CRVM if an insurer using the method complies with Type 2a Prerequisite Criteria below, and provides Reasonableness and Consistency of Assumptions Certification (Attachment 4). The appointed actuary must sign the certification. The certification shall be provided with each annual and quarterly statutory financial statement filed with the appropriate insurance regulatory official in each state in which the insurer writes or reinsures equity indexed universal life insurance business.

Type 2a Prerequisite Criteria are as follows:

1. At issue, the policy satisfies (a) or (b) as follows:
 - (a) The implied guaranteed rate for terms after the first, determined at issue using the method of Attachment 1, paragraph 3 of the CRVM with UAMV method, is less than or equal to the appropriate maximum valuation interest rate; or
 - (b) Policies with identical renewal guarantees issued in three of the past five years would have satisfied condition 1 for the Type 1 method.
2. Index-based benefit terms cannot be greater than one year. This should be interpreted consistently when a separate index-based benefit guarantee is made on each premium received.

3. The appointed actuary has demonstrated at time of filing or in conjunction with a change to a Type 2a Method, to the satisfaction of the regulatory officials in each state in which the insurer writes or reinsures equity indexed universal life insurance business, prior to the use of the CRVM with UAMV that the requirements in (1) and (2) above have been met.

Type 2 Methods

The use of a Type 2 method is not conditioned upon the requirement to meet the “Hedged as Required” criteria or the Type 2a Prerequisite Criteria. However, an insurer using a Type 2 method must provide a certification (Attachment 5) signed by the appointed actuary with each annual and quarterly statutory financial statement filed with the appropriate insurance regulatory official in each state in which the insurer writes or reinsures equity indexed universal life insurance business. This certification deals with the assumptions underlying the option market values included in the calculation of reserves using a Type 2 method and the consistency in assumptions between these option market values and the statement value of any options owned by the insurer to support the equity indexed universal life insurance business being valued.

Required Change in Method

In the event an insurer that is using a Type 1 computational method for a block of business fails to meet the applicable “Hedged as Required” criteria, the required actuarial certification must disclose this fact. If the reason for failing the “Hedged as Required” criteria is not corrected within one quarterly financial reporting period of the initial disclosure of the failure in the actuarial certification, the insurer must choose to use a Type 2a or a Type 2 computational method for determining minimum statutory formula reserves for this block of business.

If, at a later date, the insurer can demonstrate to the satisfaction of its domiciliary commissioner that it is meeting the applicable “Hedged as Required” criteria, the insurer may, with the approval of the domiciliary commissioner, resume using a Type 1 computational method. In addition, the insurer must notify the appropriate regulatory official in each state in which the insurer does business subject to the change in computational method.

Optional Change in Method

An insurer using either a Type 1, Type 2a or Type 2 computational method for a block of business may, with the approval of its domiciliary commissioner and after notifying the appropriate regulatory official in all the other states in which the insurer writes this block of business, use a computational method of another type. If the change in computational methods involves a change from a Type 2 or Type 2a computational method to a Type 1 computational method the request to the domiciliary commissioner for approval of the change in method must be accompanied with a demonstration of compliance with the applicable “Hedged as Required” criteria. If the change in computational methods involves a change from a Type 2 computational method to a Type 2a or Type 1 computational method, the request to the domiciliary commissioner for approval of the change in method must be accompanied with a demonstration of compliance with the “Type 2a Prerequisite Criteria” or the requirements specified in the section captioned “Type 1 Methods.”

Asset Adequacy Testing of Reserves

To the extent required by law, regulation, or regulatory requirements, reserves established for equity indexed life policies must be tested for adequacy using appropriate methods and assumptions.

Attachment 1
Description of Computational Methods

Implied Guaranteed Rate Method (IGRM)

To use this computational method, companies must satisfy the “Hedged as Required” criteria, which are set out in Attachment 2. On the asset side, options will be held in accordance with the rules of the NAIC Accounting and Procedures Manual.

The following describes how the IGRM works:

1. Issue date calculations:

Calculate an implied guaranteed rate, determined at issue, for the period of the initial term equal to: (a) the guaranteed interest rate for the period of the initial term; plus (b) the accumulated option cost expressed as a percent of the policy value to which the indexed benefit is to be applied. The accumulated option cost, determined at issue, is the option cost, which will provide the index-based benefit in excess of any other interest rate guarantee for the initial term, accumulated to the end of the term at the appropriate maximum valuation rate. The option cost should be as of the issue date.

Calculate an implied guaranteed rate, determined at issue, for the terms after the first. The implied guaranteed rates for terms after the first term will be based on historical moving average option costs according to (3) below.

Using the Universal Life Insurance Model Regulation, with the guaranteed interest rates equal to the implied guaranteed rates, calculate the Guaranteed Maturity Premium, Guaranteed Maturity Fund, and net premium for the policy based on guarantees at issue.

2. Valuation date calculations:

Calculate the implied guaranteed rate for the current term based on the current term’s index-based benefit and the option cost at the start of the current term that will provide the indexed benefit, in excess of any other interest rate guarantee, for the current term. The method of calculating the current term implied guaranteed rate is the same as for calculating the rate for the initial term. The implied guaranteed rate for terms after the current is not recalculated as long as neither the interest rate guarantees nor the index-based benefit guarantee have changed. (If guarantees have improved, then the new implied guaranteed rates for future terms will be based on option costs determined at issue according to (3) below.)

Continue the calculation of the reserve according to the Universal Life Insurance Model Regulation. Use the recalculated current term implied guaranteed rate and the implied guaranteed rate for future terms, as determined according to (3) below, when computing future guaranteed benefits at the valuation date. Do not recalculate the Guaranteed Maturity Premium, Guaranteed Maturity Fund, or net premium. This section should be interpreted consistently when a separate index-based benefit guarantee is made on each premium received.

In determining reserves, the net premiums, as determined in Section 1 above, are payable over the period that benefits are projected to be available, but not beyond the end of the net premium payment period determined at issue.

3. Index-based benefit guarantees beyond the current term should be handled as follows:

Calculate an implied guaranteed rate, determined at issue, for the terms after the current term equal to: (a) the guaranteed interest rate for the period of the term; plus (b) the accumulated option cost expressed as a percent of the policy value to which the indexed benefit is to be applied. The accumulated option cost is the historical moving average cost of the option whose term begins at the beginning of the term, which will provide the index-based benefit in excess of any other interest rate guarantee for the term, accumulated for the length of the term at the appropriate maximum valuation rate.

The historical moving average cost of the option will be calculated based on the averages over the sixty months previous to the calendar year of issue of each of the following items: (a) 3% plus the annualized daily actual index volatility as the estimated implied volatility for a one year European At-The-Money option, e.g. if the average index volatility is 15%, the implied volatility for the base case option cost is 18%; (b) index dividend rate; and (c) risk free rate. The base case cost is for a one year European At-The-Money option and must be adjusted to the characteristics of the policy.

In those states that require, by regulation, that the policy valuation interest rates not exceed the “minimum guaranteed interest rate” in the policy, the “minimum guaranteed interest rate” for IGRM is the implied guaranteed rate.

Commissioners Reserve Valuation Method Updated Average Market Value (CRVM with UAMV)

To use this computational method, companies must satisfy the Type 2a Prerequisite Criteria. On the asset side, options will be held in accordance with the rules of the NAIC Accounting and Procedures Manual. Similarly, reinsurance reserve credit will be in accordance with the rules of the NAIC Accounting and Procedures Manual.

The following describes how the CRVM with UAMV works:

1. Issue date calculations:

Calculate an implied guaranteed rate, determined at issue, for the period of the initial term equal to: (a) the guaranteed interest rate for the period of the initial term; plus (b) the accumulated option cost expressed as a percent of the policy value to which the indexed benefit is to be applied. The accumulated option cost, determined at issue, is the option cost that will provide the index-based benefit in excess of any other interest rate guarantee for the initial term, accumulated to the end of the term at the appropriate maximum valuation rate. The option cost should be as of the issue date.

Calculate an implied guaranteed rate, determined at issue, for the terms after the first. The implied guaranteed rates for terms after the first term will be based on historical moving average option costs according to (3) below.

Using the Universal Life Insurance Model Regulation, with the guaranteed interest rates equal to the implied guaranteed rates, calculate the Guaranteed Maturity Premium, Guaranteed Maturity Fund, and net premium for the policy based on guarantees at issue.

2. Valuation date calculations:

When calculating the present value of future guaranteed policy benefits at the valuation date by projecting a fund equal to the greater of the Guaranteed Maturity Fund or the policy value, this fund should be projected to the end of the current term at the guaranteed interest rate and added to

the accumulated option cost for the current term. The option cost should be determined as of the valuation date.

The option should provide for the index-based benefit in excess of any other interest rate guarantee for the current term based on a fund equal to the greater of the Guaranteed Maturity Fund or the policy value. The option cost should be accumulated to the end of the current term at the appropriate maximum valuation rate in accordance with the SVL.

This combined amount should then be projected forward using the implied guaranteed rates for future terms, as determined according to (3) below.

The implied guaranteed rates for terms after the current are recalculated on the valuation date. The implied guaranteed rates for future terms will be based on historical moving average option costs on the valuation date according to (3) below.

Do not recalculate the Guaranteed Maturity Premium, Guaranteed Maturity Fund, or net premium. This section should be interpreted consistently when a separate index-based benefit guarantee is made on each premium received.

In determining reserves, the net premiums, as determined in Section 1 above, are payable over the period that benefits are projected to be available, but not beyond the end of the net premium payment period determined at issue.

3. Index-based benefit guarantees beyond the current term should be handled as follows:

Calculate an implied guaranteed rate, determined either at issue or at a valuation date, for the terms after the current term equal to: (a) the guaranteed interest rate for the period of the term; plus (b) the accumulated option cost expressed as a percent of the policy value to which the indexed benefit is to be applied. The accumulated option cost is the historical moving average cost of the option whose term begins at the beginning of the term, which will provide the index-based benefit in excess of any other interest rate guarantee for the term, accumulated for the length of the term at the appropriate maximum valuation rate.

The historical moving average cost of the option will be set equal to the option cost calculated based on the averages of each of the following items over the sixty months previous to the calendar year of the determination date: (a) 3% plus the annualized daily actual index volatility as the estimated implied volatility for a one year European At-The-Money option, e.g. if the average index volatility is 15%, the implied volatility for the base case option cost is 18%; (b) index dividend rate; and (c) risk free rate. The base case cost is for a one year European At-The-Money option and must be adjusted to the characteristics of the policy.

In those states that require, by regulation, that the policy valuation interest rates not exceed the “minimum guaranteed interest rate” in the policy, the “minimum guaranteed interest rate” for CRVM with UAMV is the implied guaranteed rate.

CRVM with Updated Market Value (UMV) Method

CRVM with UMV applies the Universal Life Insurance Model Regulation to equity indexed life insurance policies using the following methods:

1. Issue date calculations:

When calculating the present value of future guaranteed policy benefits at issue by projecting fund values, the fund should be projected to the end of the initial term at the guaranteed interest rate and added to the accumulated option cost for the initial term. This combined amount should

then be projected forward, using the policy guarantees to determine future death and endowment benefits. The option should provide for the indexed benefit in excess of any other interest rate guarantee for the initial term. The option cost should be as of the issue date. The option cost should be accumulated to the end of the initial term at the appropriate maximum valuation rate in accordance with the SVL. Any index-based benefit guarantees beyond the initial term should be determined as described in (3) below.

Using this method of determining the present value of future guaranteed benefits, calculate the Guaranteed Maturity Premium, Guaranteed Maturity Fund, and net premium for the policy based on guarantees at issue.

2. Valuation date calculations:

When calculating the present value of future guaranteed policy benefits at the valuation date by projecting a fund equal to the greater of the Guaranteed Maturity Fund or the policy value, this fund should be projected to the end of the current term at the guaranteed interest rate and added to the accumulated option cost for the current term. The option cost should be determined as of the valuation date. This combined amount should then be projected forward, using the policy guarantees to determine future death and endowment benefits. The option should provide for the index-based benefit in excess of any other interest rate guarantee for the current term, based on a fund equal to the greater of the Guaranteed Maturity Fund or the policy value. The option cost should be accumulated to the end of the current term at the appropriate maximum valuation rate in accordance with the SVL. Any index-based benefit guarantees beyond the current term should be treated as described in (3) below. Do not recalculate the Guaranteed Maturity Premium, Guaranteed Maturity Fund, or net premium. This section should be interpreted consistently when a separate index-based benefit guarantee is made on each premium received.

In determining reserves, the net premiums, as determined in Section 1 above, are payable over the period that benefits are projected to be available, but not beyond the end of the net premium payment period determined at issue.

3. Index-based benefit guarantees beyond the current term should be handled as follows:

At the time of calculation, fund values projected to the end of the current term should be further projected to the end of the next term at the guaranteed interest rate. This should be added to the accumulated option cost for that term. This should be done successively for each subsequent term, using the appropriate option cost for each term. The option for each term should provide for the index-based benefit in excess of any other interest rate guarantee for the term. The cost for each option should recognize the current relevant economic condition on the calculation date and be priced as if the term began on that date. The option cost for each future term should be accumulated to the end of the term at the appropriate maximum valuation rate in accordance with the SVL.

Attachment 2
Hedged as Required Criteria - Life Products

In order to use a Type 1 computational method, the appointed actuary needs to certify quarterly that it meets either the “Basic” or “Option Replication” criteria.

Basic

1. Required equivalence of characteristics between the option policies held and the options embedded in the policies for the current term with respect to specific policy features such as: index; averaging features; option type; strike price; term; etc.
2. The amount of hedge owned must substantially cover the greater of the account value or reserve. “Substantially” is measured by the guarantees in the specific policy (some policies may have longer term guarantees than others), and allows the company to assume no more than 6% per year of elective benefit decrements, unless the Commissioner agrees to a higher limit. Benefit decrements due to charges in the policy should be taken into account in the same way as they are in the indexed interest formula in the policy (i.e., if indexed interest is credited on an average fund value, then it is the projected average fund value on each policy which should be hedged.)
3. The company must have a specific plan for hedging risks associated with death benefits, early surrenders, unexpected premium payment patterns, and other potentialities. This plan must be available at issue and updated at every valuation date, or as often as the valuation actuary requirements may warrant.
4. The company must have a system in place that is used to monitor the effectiveness of its hedging strategy.
5. The company must have a stated maximum tolerance for differences between expected performance of the hedge and the actual results of the hedge.

Option Replication

1. Required equivalence of characteristics between the target of an option replication strategy employed and the options imbedded in the liabilities for the current term with respect to specific policy features such as: index; averaging features; option type; strike price; term; etc.
2. At the end of each quarter, the notional amount of the target of the option replication strategy must substantially cover the greater of the account value or reserve. “Substantially” is measured by the guarantees in the specific policy (some policies may have longer term guarantees than others), and allows the company to assume no more than 6% per year of elective benefit decrements, unless the Commissioner agrees to a higher limit. Benefit decrements due to charges in the policy should be taken into account in the same way as they are in the indexed interest formula in the policy, (i.e., if indexed interest is credited on an average fund value, then it is the projected average fund value on each policy which should be hedged.)
3. The company must have a specific plan for hedging risks associated with death benefits, early surrenders, unexpected premium payment patterns and other potentialities. This plan must be available at issue and updated at every valuation date, or as often as the valuation actuary requirements may warrant.
4. The company must have a system in place that is used to monitor the effectiveness of the company’s hedging strategy.

5. The company must have a stated maximum tolerance for differences between the expected performance of the hedge and the actual results of the hedge. The maximum tolerance test and compliance evaluation test must meet the following minimum requirements. The compliance evaluation criterion will be a retrospective correlation test performed at least on a weekly basis. The company will compare the change in the market value, from the beginning of the calendar quarter, of the hedge portfolio with the change in the market value of the target of the option replication strategy. The maximum dollar amount of difference permitted between these two changes is 10% of the beginning of period market value of the target of the option replication strategy. If the difference exceeds this limit, the following steps must be taken:
- ◆ If for a second time during a quarter the dollar amount of difference exceeds 10% of the beginning of period market value of the target of the option replication strategy, but is less than 25% of the beginning of period market value of the target of the option replication strategy, the company must notify the Commissioner in each state in which the insurer is licensed. The notification must indicate the dollar amount of reserves being hedged by the option replication strategy.
 - ◆ If at any of the weekly intervals the difference between the two changes exceeds 25% of the beginning of period market value of the target of the option replication strategy, the company must notify the Commissioner in each state in which the insurer is licensed. The notification must indicate the dollar amount of reserves being hedged by the option replication strategy and the impact on surplus of reporting the reserves based on CRVM with UMV, or CRVM with UAMV if the conditions for that method are satisfied.
 - ◆ If at any point in time during the quarter the difference between the two changes exceeds 35% of the beginning of period market value of target of the option replication strategy, the insurer is deemed to be out of compliance with the “Hedged as Required” criteria, and the company must notify the Commissioner in each state in which the insurer is licensed. The notification must indicate the dollar amount of reserves being hedged by the option replication strategy and the impact on surplus of reporting the reserves based on the CRVM with UMV, or CRVM with UAVM if the conditions for that method are satisfied.

The requirements discussed above deal with the situation in which the actual hedge underperforms relative to the expected hedge performance. The ability of an insurer to over-hedge may be constrained by other components of a state’s regulatory framework including the state’s investment article and regulations concerning the use of derivative instruments. For purposes of this Guideline, over-hedged mean that at a particular point in time, the hedge portfolio exceeds the portfolio of liabilities being hedged. If over-hedged, the excess hedging instruments are excluded from the measurements required in Item 5 of the Hedged as Required Criteria.

Attachment 3
Reasonableness of Assumptions Certification
for Implied Guaranteed Rate Method

The following certification must be filed in conjunction with each quarterly and annual statutory financial statement filed with the appropriate regulatory official in each state in which the insurer does business. The appointed actuary must sign the certification.

I, (state name and professional designation) am the appointed actuary for (company name). The company meets the Hedged as Required criteria for policies reserved under the Implied Guarantee Rate Method. I have reviewed the assumptions underlying the values assigned to all equity index options used in the determination of the implied guaranteed rate used in the calculation of reserves under the Implied Guaranteed Rate Method for all equity indexed universal life insurance policies issued or reinsured by (company name) and reported in the statutory financial statement as of (the date of valuation).

The assumptions at the start of the current term used to determine such option values for the current term are:

1. Reasonable in light of current relevant economic conditions at the start of the current term; and
2. Consistent with the comparable assumptions used to determine the statement of value of any derivative instruments as of the valuation date used to hedge the equity index-based obligations embedded in the equity indexed life policies subject to this certification.

The assumptions at issue used to determine equity index option values for terms subsequent to the current term are:

1. Determined in accordance with the Implied Guaranteed Rate Method
2. Based on quantitative data for the base case option (1-year European At-The-Money) of 3% plus ____% average annualized daily actual volatility over the 60 months previous to the calendar year of issue.
3. Reasonably adjusted to reflect the following variances from the base case due to benefit design and capital market reasons (all material adjustments should be listed)
 - a. skew adjustments
 - b. _____ (to be described by appointed actuary)
4. Reliant on the following source(s) for assumptions not prescribed by this Actuarial Guideline:
 - a. _____ (to be described by appointed actuary)

(Name of actuary)

(Signature of actuary)

(Date of certification)

Attachment 4
Reasonableness and Consistency of Assumptions Certification
for Commissioners Reserve Valuation Method with Updated Average Market Value

The following certification must be filed in conjunction with each quarterly and annual statutory financial statement filed with the appropriate regulatory official in each state in which the insurer does business. The appointed actuary must sign the certification.

I, (state name and professional designation) am the appointed actuary for (company name). I have reviewed the assumptions underlying the values assigned to all equity index options used in the determination of statutory reserves using a Type 2a computational method for all equity indexed universal life insurance policies issued or reinsured by (company name) insurance company and reported in the statutory financial statement as of (the date of valuation).

The assumptions used to determine such option values for the current term are:

1. Reasonable in light of current relevant economic conditions as of the date of valuation; and
2. Consistent with the comparable assumptions used to determine the statement of value of any derivative instruments as of the valuation date used to hedge the equity index-based obligations embedded in the equity indexed life policies subject to this certification.

The assumptions used to determine equity index option values for terms subsequent to the current term are:

1. Determined in accordance with the Commissioners Reserve Valuation Method with Updated Average Market Value
2. Based on quantitative data for the base case option (1-year European At-The-Money) of 3% plus ____% 60 -month moving average annualized daily actual volatility
3. Reasonably adjusted to reflect the following variances from the base case due to benefit design and capital market reasons (all material adjustments should be listed)
 - a. skew adjustments
 - b. _____ (to be described by appointed actuary)
4. Reliant on the following source(s) for assumptions not prescribed by this Actuarial Guideline:
 - a. _____ (to be described by appointed actuary)

 (Name of actuary)

 (Signature of actuary)

 (Date of certification)

Attachment 5
Reasonableness and Consistency of Assumptions Certification
for Commissioners Reserve Valuation Method with Updated Market Value

The following certification must be filed in conjunction with each quarterly and annual statutory financial statement filed with the appropriate regulatory official in each state in which the insurer does business. The appointed actuary must sign the certification.

I, (state name and professional designation) am the appointed actuary for (company name). I have reviewed the assumptions underlying the values assigned to all equity index options used in the determination of statutory reserves using a Type 2 computational method for all equity indexed universal life insurance policies issued or reinsured by (company name) insurance company and reported in the statutory financial statement as of (the date of valuation). The assumptions used to determine such option values are:

1. Reasonable in light of current relevant economic conditions as of the date of valuation; and
2. Consistent with the comparable assumptions used to determine the statement of value of any derivative instruments as of the valuation date used to hedge the equity index-based obligations embedded in the equity indexed life policies subject to this certification.

Actuarial Guideline XXXVII

VARIABLE LIFE INSURANCE RESERVES FOR GUARANTEED MINIMUM DEATH BENEFITS

Background

This guideline's primary focus is to clarify the appropriate projection assumptions and methodologies used to determine statutory reserve liabilities for Guaranteed Minimum Death Benefits (GMDBs) offered with variable life insurance products.

For many years, insurance companies have not applied uniform reserve standards to variable life insurance policies in general, and to GMDBs in particular. Four regulatory sources are often looked to for guidance. First, the Standard Valuation Law (SVL) requires that CRVM be based on the present value of future guaranteed benefits. Second, the Variable Life Insurance Model Regulation as revised in 1983 and again in 1989 states "Reserve liabilities for variable life insurance policies shall be established under [SVL] in accordance with actuarial procedures that recognize the variable nature of the benefits provided and any mortality guarantees." Third is the Universal Life Insurance Model Regulation and most recently the Valuation of Life Insurance Policies Model Regulation.

GMDBs are common features of variable life products. Recently, reserve methods for universal life secondary guarantees have been clarified in the Valuation of Life Insurance Policies Model Regulation. These secondary guarantees are similar to GMDBs offered with variable life policies. A Guaranteed Minimum Death Benefit is any guarantee which provides death benefit protection which would not otherwise be provided in the absence of such a guaranteed benefit or provision. An example of a GMDB is a policy in which death benefits continue in-force even if the policy value is zero. This benefit may be contingent on additional qualifications being met, such as cumulative premiums meeting some limit.

Additional examples of GMDBs are provided below. This list is not intended to include all types of GMDBs.

- A Minimum Death Benefit Provision or No Lapse provision where death benefits are guaranteed to remain in-force for a period of time even if the policy value is not greater than zero subject only to certain conditions being met such as cumulative premiums meeting a minimum amount, or if a theoretical policy value is sufficient to meet a minimum amount.
- Death Benefits that are guaranteed to be at least as large as the original face amount, regardless of investment performance which might generate negative Paid Up Additions on a traditional fixed premium variable life insurance policy.

The Variable Life Insurance Model Regulation defines the reserve methodology for variable life policies. However, currently two versions of the model regulation exist and this results in inconsistent treatment by state. These two versions include the 1983 revisions and the 1989 revisions to the model regulation. Many states have not passed either revision and therefore require direct interpretation of SVL. In practice, companies have interpreted these regulations inconsistently with regard to assumptions and/or application to current products available today. The 1983 version of the regulation treats flexible premium policies differently than scheduled premium policies. The 1983 version of the regulation did not anticipate the types of GMDBs available today which require contingent conditions to be met to maintain a death benefit guarantee, for instance specified premiums must be paid. Thus, confusion exists with regard to which valuation method is appropriate. The 1989 version makes no distinction between the scheduled premium and flexible premium policies.

This Guideline codifies the basic interpretation of reserve liabilities for variable life GMDBs by clarifying the projection assumptions and methodologies that comply with the SVL. Minimum valuation standards that may be used to determine this reserve and are not specifically addressed in this guideline are defined by SVL and other applicable state regulations. This guideline focuses on the methodology of the 1989 revisions to interpret SVL, as we believe the 1989 revision more appropriately considers the types of products and GMDBs available today.

Interpretations of both the 1983 and 1989 versions reflect the comments made in the December 1972 report which concluded that an acceptable GMDB reserve system should have the following characteristics:

1. The GMDB reserve should be held in the general account of the company so that it will be backed by the general assets of the company, most of which are debt obligations valued at amortized cost and, therefore, are of a fixed dollar nature. It would not be proper to hold the GMDB reserve in the separate account, assuming the reserve is not supported by fixed dollar assets but by assets that are moving in the opposite direction from the risk, i.e. value moving downward while the risk increases and vice versa.
2. The GMDB reserve should be adequate to cover the GMDB death claims for the next year in all but the most extreme circumstances so that the regulatory authorities can be assured the company will not run into financial trouble from this source before the next annual statement is filed.
3. The GMDB reserve should react slowly but steadily through an extended period of poor investment experience of the separate account.
4. The GMDB reserve should not cause unnecessary fluctuations in surplus by increasing too rapidly in a sharp market downswing. Also, the reserve should not decrease too rapidly in a sharp market upswing after a period of poor market performance.

This guideline maintains the four principles above in interpreting the Standard Valuation Law as it relates to variable life business and the methods defined in both the 1983 and 1989 versions of the Variable Life Insurance Model Regulation.

Reserve methodologies which recognize the variable nature of GMDB are defined in the Variable Life Insurance Model Regulation and include a One-Year Term reserve recognizing a 1/3 drop in separate account assets, the Attained Age Level Reserve (AALR) methodology and in the 1983 version, a methodology for flexible premium policies. Reserves for GMDBs are held in the general account.

This guideline recognizes the following principles when determining appropriate reserves for GMDB.

- Determine the guaranteed death benefits which are not valued in the basic policy reserves.
- Establish a reserve for these benefits over the period of time in which revenue is collected to pay for such benefits; however, no greater than the period of time these guaranteed benefits are provided.
- Collected revenue should not be de-minimus in order to reduce the reserve.
- The reserve established is in addition to basic reserves

This guideline interprets the standards for applying these methodologies. This guideline also interprets the projection assumptions to be applied to determine excess guaranteed death benefits. The guideline clarifies the use of the AALR methodology for flexible premium variable life policies with contingent

GMDB benefit structures similar to specified premium contracts. This guideline is based on the belief that the 1983 revisions did not anticipate these types of GMDB benefits on flexible premium contracts. Thus, it makes sense to interpret the 1983 revisions for these types of GMDB benefits by applying the AALR methodology when there is a contingent GMDB structure. For flexible premium plans with other types of GMDBs, the flexible premium language of the 1983 revision is used where applicable.

The AALR methodology, along with the one-year term reserve is generally consistent with the principles above in that additional reserves are established in recognition of all death benefit guarantees not reflected in basic reserves. If multiple guarantees exist all guarantees must be valued and the greatest additional reserve is held. Consecutive GMDBs are treated as a single guarantee. These reserves are funded over the period of time GMDB Revenue will be collected through either policy charges or premiums, however, not to exceed the GMDB benefit period. The AALR methodology funds any GMDB Revenue deficiency over the period of time the Revenue is collected, however, no longer than the end of the guarantee period.

GMDB reserves are held in addition to basic reserves unless the appointed actuary provides satisfactory documentation to the state of domicile insurance department stating why such reserves are redundant. For example, for traditional variable life product designs where reserves are generally determined on a tabular basis and use an assumed interest rate (AIR), if basic reserves are determined based on at least the guaranteed face amount, (i.e. ignoring any negative additions) then the guaranteed death benefit is fully reflected in the basic reserves; therefore, an additional GMDB reserve is redundant. Neither this guideline nor the 1989 amendments specifically address traditional variable life product designs, nor does this guideline specifically exclude these designs from its scope.

An additional purpose of this guideline is to emphasize the impact of Sections 3A(3) and 3A(4) in the Valuation of Life Insurance Policies Model Regulation (“XXX”) relative to reserving for variable life and variable universal life products.

Scope

The guideline applies to all variable life insurance contracts to which the Standard Valuation Law applies and which provide Guaranteed Minimum Death Benefits (GMDBs) either explicitly or implicitly.

Definitions

Attained age level reserve (AALR): The AALR is a methodology described in the 1983 and 1989 revisions to the Variable Life Insurance Model Regulation.

Catch-up provision: A Catch-up provision is a provision in the policy that gives the policyholder the right to catch up on any contingent requirements in order to maintain the GMDB.

Guaranteed Period: The guaranteed period is the period of time over which a GMDB is guaranteed regardless of the basic guarantees in the policy. A policy may have multiple guaranteed periods and GMDBs.

Guaranteed Minimum Death Benefit (GMDB): A Guaranteed Minimum Death Benefit (GMDB) is any guarantee which provides continued death benefit protection which would not otherwise be provided in the absence of such a guaranteed benefit or provision. A policy may have multiple GMDBs.

One-Year Term (OYT) reserve: The OYT reserve covers a period of no more than one year following a 1/3-asset drop. This reserve is fully described in the 1989 revision to the Variable Life Insurance Model Regulation. This guideline clarifies the methodology and the assumptions used to determine OYT reserves.

Policy Value: Policy value means, as of the valuation date, the greater of (a) zero and (b) the amount to which separately identified interest credits and/or investment return and mortality, expense, or other

charges are made under a variable life insurance policy. Subsequent to the valuation date, “policy value” means the amount determined in accordance with the procedures specified in this guideline.

Projection Assumptions: The Projection Assumptions are used to determine guaranteed death benefits. This projection of policy values uses the following assumptions:

1. Cost of insurance rates are equal to the minimum valuation mortality.
2. The GMDB is assumed to be in effect for the maximum period of the GMDB. All minimum requirements necessary to maintain the GMDB in force subsequent to the valuation date are assumed to be met at the latest point in time sufficient to maintain the GMDB through its maximum period. Contingent requirements, if any, required to reinstate or catch-up as of the valuation date are assumed to occur on the valuation date. If the GMDB would continue in effect subsequent to the valuation date with no additional actions required, contingent requirements are assumed not to resume until the latest point in time which would prevent the termination of the GMDB.
3. The general account policy values and separate account policy values are projected at the valuation interest rate. The assumed investment rate, if any, is used when determining the OYT reserve.
4. The guaranteed period covered is determined assuming all contingent requirements are met.
5. Policy options and benefits are assumed to continue unchanged as of the valuation date. Examples include fixed and variable account allocation and the death benefit option.
6. The projection of policy values is made for the entire guarantee period, regardless of whether projected policy values are positive or negative at any point in the projection. Any negative policy value would be set to zero.

The policy value is projected forward from the valuation date with valuation interest rate credits, any payments required to maintain the guarantee and valuation mortality charges (and no other credits or charges). The Guideline stipulates that “A death benefit in the absence of the guarantee is assumed to be provided as long as the projected policy value is greater than zero,” and “Any negative policy value would be set to zero.” An AALR need not be established for a VUL policy to provide for any period during which there would be a death benefit in the absence of the guarantee, since this benefit would be provided for by the policy’s basic reserve. This means that for an AALR to develop, the mortality charges must exceed the required payments plus interest credits by enough to reduce the policy value to zero during the guarantee period. Surrender charges are not relevant to this determination.

GMDB Revenue: GMDB Revenue is policy charges or premium, either implicit or explicit. These charges or premiums may or may not be explicitly stated to cover GMDB benefits. An example of an implicit premium is a positive premium necessary to maintain a target policy value in order to maintain benefits.

Term cost: Term costs are based on the guaranteed minimum death benefits in excess of the death benefits that would be provided in absence of such guarantee based on a projection of policy values using the Projection Assumptions defined above. These costs are then discounted to the valuation date. The term costs are based on minimum valuation mortality standards and a discount rate not to exceed the maximum valuation interest rate.

1/3-Asset Drop: A 1/3 reduction in separate account assets that is used in the calculation of the one-year term reserve. This 1/3 drop is not applied to fixed account assets.

Text

1. Basic Reserves:

Basic Reserves include the reserve held for death benefits provided in the absence of a GMDB. Reserve liabilities for variable life insurance policies shall be established consistent with the methodologies described in the Standard Valuation Law and in accordance with actuarial procedures that recognize the variable nature of the benefits provided and any mortality guarantees. Reserve methods described in the Variable Life Insurance Model Regulation and the Universal Life Insurance Model Regulation may be appropriately utilized to determine reserve liabilities such that application of these methods is consistent with the principles of the Standard Valuation Law.

2. Guaranteed Minimum Death Benefit Reserves:

Additional reserves are required to provide for liabilities of GMDB provisions which provide benefits that would not be provided in the absence of the guarantee. In measuring these liabilities, the basic reserve provides for death benefits which occur in the absence of the guarantee. GMDB reserves provide for the contingency of death occurring when the guaranteed minimum death benefit exceeds the death benefit that would be paid in absence of the guarantee. A consistent reserve methodology should be used regardless of whether a contract has scheduled premiums or flexible premiums.

When a contract provides multiple GMDBs and/or multiple guarantee periods, a reserve is established based on the guaranteed period which produces the greatest reserve as of the valuation date. Consecutive GMDBs are treated as a single guarantee period. The reserve methodology reflects all potential guarantee periods assuming that contingent requirements are met such as: contingent premiums paid, Catch-up Provisions or any pre-funding of contingent requirements.

For a policy under the 1989 revisions or a flexible premium policy with contingent GMDBs similar to a specified premium contract under the 1983 revision, the GMDB reserve equals the greater of (1) and (2) where (1) equals “the aggregate total of term costs” (OYT) which covers a period of no more than one year following a 1/3-asset drop, and (2) equals the AALR as described below.

For a flexible premium policy under the 1983 revisions not covered above, (where the GMDB guarantee is not contingent on any policyholder requirement), reserve liabilities for any guaranteed minimum death benefit shall be maintained in the general account of the insurer and shall be not less than the aggregate total of the term costs, if any, covering the period provided for in the guarantee not otherwise provided for by the reserves held in the separate account assuming a 1/3-asset drop, projected at the valuation interest rate.

a) One Year Term Reserves (OYT):

This reserve component equals the “aggregate total of term costs”, if any, covering a period of one full year from the valuation date, or, if less, covering the period of time death benefits are provided which are not otherwise provided for by the basic reserves. This reserve assumes any contingent requirements to maintain the GMDB are met by reflecting any Catch-up Provisions or any pre-funding of contingent requirements.

“Aggregate total term costs” equals the present value of guaranteed minimum death benefits in excess of death benefits that would be provided in absence of such guarantee, if any, prior to the end of one full year or the end of the guaranteed period if sooner. A death benefit in the absence of the guarantee is assumed to be provided as long as the projected policy value is greater than zero. Death benefits are determined by projecting the policy value following a 1/3-asset drop and using the Projection Assumptions defined above. Present values are determined using valuation mortality rates and the maximum valuation interest rate.

b) Attained Age Level Reserves (AALR):

This reserve component allows for funding GMDBs over no longer than the guaranteed period. This reserve assumes contingent requirements are met to maintain the GMDB and reflect any prepaid contingent requirements or Catch-up provisions. A death benefit in the absence of the guarantee is assumed to be provided as long as the projected policy value is greater than zero. This reserve component exists until no later than the end of the guarantee period if, on any prior valuation date, projected policy values resulted in guaranteed minimum death benefits in excess of death benefits that would be provided in absence of such guarantee. To the extent long term favorable investment performance results in redundant reserves, the valuation actuary may request permission from the state of domicile insurance department to release all or a portion of the redundant GMDB reserves. This projection of policy value is based on the Projection Assumptions defined above and does not incorporate a 1/3-asset drop.

The AALR reserve component shall not be less than zero and shall equal the “residue,” as described in paragraph (1) below, of the prior year’s AALR on the contract, with any such “residue,” increased or decreased by a “payment” computed on an attained age basis as described in paragraph (2) below.

- (1) The “residue” of the prior year’s AALR on each variable life insurance contract shall not be less than zero and shall be determined by adding interest at the maximum valuation interest rate to such prior year’s reserve, deducting the tabular claims based on the “excess”, if any, of the guaranteed minimum death benefit over the death benefit that would be payable in absence of such guarantee, and dividing the result by the tabular probability of survival. Hence, tabular costs are only deducted for years where, in the absence of the guarantee, coverage would be less than the guaranteed coverage.
- (2) The “payment” used to increase or decrease the “residue” above shall be computed so that the present value of a level payment of that amount each year over the future period for which GMDB Revenue will be collected under the contract is equal to (A) minus (B) minus (C), where, (A) is the present value of future guaranteed minimum death benefits. The future guaranteed minimum death benefits are the projected future death benefits including the GMDB. (B) is the present value of the projected future death benefits that would be payable in the absence of the GMDB. The guaranteed benefit for (A) and (B) should be calculated for the life of the policy. Both (A) and (B) are calculated based on the Projection Assumptions. (C) is any “residue,” as described in paragraph (1) above, of the prior year’s AALR on such variable contract. Minimum standards of valuation mortality assumptions and maximum valuation interest rates are used to determine present values and net level payments. The period of time in which GMDB Revenue will be collected is limited to the period of time policy values are sufficient to collect policy charges or the period of time contingent requirements will be paid to maintain the GMDB. In no event will the time period be greater than the time to the end of the guarantee period. It should also be noted that the “payment” may be negative resulting in the reserve running off over the remaining guarantee period.

c) Other Flexible Premium Policies under the 1983 revisions not included above:

The present value of potential guaranteed minimum death benefits in excess of death benefits that would be provided in absence of such guarantee is determined by using

minimum standards of valuation mortality assumptions and maximum valuation interest rates.

3. Issues:

Sections 3A(3) and 3A(4) of “XXX” state the following:

3A(3): This regulation shall not apply to any variable life insurance policy that provides for life insurance, the amount or duration of which varies according to the investment experience of any separate account or accounts.

3A(4): This regulation shall not apply to any variable universal life insurance policy that provides for life insurance, the amount or duration of which varies according to the investment experience of any separate account or accounts.

The language of these sections is clear. The reserving for variable life and variable universal life is in no way affected by the provisions of “XXX.” In particular, the 19-year select factors and the “X” factor are not applicable to the calculation of reserves for variable life and variable universal life products.

Effective Date

This guideline affects all variable life insurance contracts issued. Where the application of this Guideline produces higher reserves than the company had otherwise established by their previously used interpretation, such company must comply with this guideline effective December 31, 2001. However, such company may request a grace in period, not to exceed three (3) years, from the domiciliary Commissioner upon satisfactory demonstration of the previous interpretation and that such delay of implementation will not cause a hazardous financial condition or potential harm to its policyholders.

Retroactive application of the guideline to in-force policies to develop the current residue portion of the AALR will generally not be feasible. Therefore, the residue as of 12/31/2000 should be set equal to the greater of the amount established by the company under its current method or \$0 if the company did not previously calculate an AALR.

Actuarial Guideline XXXVIII

THE APPLICATION OF THE VALUATION OF LIFE INSURANCE POLICIES MODEL REGULATION

Introduction

The revised version of the *Valuation of Life Insurance Policies Model Regulation* (Model #830) was adopted by the NAIC in March 1999. Since that date, some questions have been raised regarding whether and how Model #830 applies to various product designs. The purpose of this guideline is to provide direction as to the application of Model #830 to such products. Specifically, this guideline provides examples of various policy features that constitute “guarantees” and gives directions on how to reserve for these guarantees in accordance with Model #830.

Obviously, new policy designs will emerge subsequent to the development of this document. No statute, regulation, or guideline can anticipate every future product design, and common sense and professional responsibility are needed to assure compliance with both the letter and the spirit of the law. While Model #830 is a complex regulation, its intent is clear: reserves need to be established for the guarantees provided by a policy. Policy designs which are created to simply disguise those guarantees or exploit a perceived loophole must be reserved in a manner similar to more typical designs with similar guarantees.

Text

The following product designs have been brought to the attention of the NAIC Life Actuarial (A) Task Force. The list below specifies reserving approaches which the Task Force regards as being most consistent with the letter and spirit of Model #830. However, the specified reserving approaches should be modified as needed to comply with the intent of this guideline that similar reserves be established for policy designs that contain similar guarantees.

1. An initial level premium rate is guaranteed for 10 years followed by increased guaranteed premiums for an additional 20 years. However, the company cannot increase premiums after year 10 (i.e., the initial premium continues to be charged) unless some specified event occurs.

The initial reserve segment is 30 years. Since the contract contains provisions that limit the company’s ability to increase premiums, then the initial premium should be treated as guaranteed for the entire 30-year period. It would be contrary to the conservative nature of statutory accounting to treat this policy the same as one in which the ability to raise premiums is unrestricted.

2. A term policy has an illustrated level premium for 30 years, the first 10 of which are guaranteed. Additionally, there is a refund option which provides that a specified refund will be paid if the premium ever increases. The refund must be requested within a limited time (e.g., 30 days) of receiving notice of the increase. Coverage terminates if the option is exercised.

This example differs from the one above in that there is no specified event that has to occur in order for the company to impose a premium increase; however, the company must provide an additional benefit to the policyholder if it exercises this right. Thus the company does not have an unrestricted right to impose an increase after 10 years. If the contract contains provisions that require that additional benefits be provided to the policyholder in the event of a premium increase, even if these benefits are lost if not claimed within a stated time frame, then the initial premiums should be treated as guaranteed for the entire 30 year period. It would be contrary to the conservative nature of statutory accounting to treat this policy the same as one in which the

ability to raise premiums does not require that additional benefits be provided. Therefore, the initial segment for this policy is 30 years.

3. An initial level premium rate is guaranteed for 10 years followed by increased guaranteed premiums for an additional 20 years. However, after year 10 the policyholder is protected against premiums being increased above the initial level, with the protection provided by a second company through either reinsurance, a second policy issued to the consumer, or an agreement between the companies.

The combined reserves of the direct writer and the second company should be no less than the amount which the direct writer would hold if (a) there were no second company and (b) the initial reserve segment were 30 years. If this condition is not met, reserve credits for the direct writer should be disallowed. The reserve held by the direct writer should be based on the initial level premium being guaranteed for 30 years.

4. A product has relatively high gross premiums but with a guaranteed dividend or guaranteed refund schedule, or by some other means guarantees a low net cost to the policyholder.

The net amount of premium (i.e., gross premium less dividends or refunds) should be used in the reserve calculation. That represents the amount the insured actually pays for coverage.

For products reinsured on either a coinsurance or modified coinsurance basis, the reinsurer's reserve calculation should also be based on the net premium (i.e., gross premiums less dividends or refunds guaranteed to be paid to the policyholder).

5.
 - a) A re-entry term product has an initial rate guarantee for 10 years, with loose or non-existent re-entry underwriting, allowing the policyholder to re-enter for an additional 20 years at specified favorable rates.
 - b) A universal life policy has provisions such that, if the UL policy lapses prior to the 10th policy anniversary because the actual accumulation value (or cash value, depending on design) falls below zero but stipulated premiums have been paid, a substitute policy is guaranteed to be issued providing the same amount of insurance coverage at the same stipulated premium for the remainder of the 10-year period plus an additional 20 years.

The reentry periods and premiums should be treated as a continuation of the initial guarantees for reserve calculation purposes. The initial reserve segment applicable to the original policy should be 30 years if the stipulated premium for the substitute policy is not high enough to trigger a new reserve segment. When the substitute policy is issued, reserves should be determined as if the coverage had been issued at the issue age and issue date of the original policy. Effectively, the company has guaranteed coverage for 30 years at the time the initial policy is issued, and the reserves established should reflect that guarantee.

6. A reinsurance treaty provides for 30 years of level premiums on a current scale but directly guarantees those premiums for only the first 10 years. However, if the reinsurer increases the premiums after 10 years, the reinsurer agrees to increase the expense allowance such that the net payments (premium minus allowance) by the direct writer remains unchanged.

Relative to the reinsurer's reserve calculation, the initial reserve segment should be 30 years and the valuation premium should be level over that period. In this instance, the additional "expense allowance" has no relationship to the expenses actually incurred by the direct writer in administering the reinsured policies. Although a bona fide expense allowance would typically not be considered in determining the valuation premiums and reserve segments, in this instance the

additional “expense allowance” has no relationship to the expenses actually incurred by the direct writer in administering the reinsured policies.”

7. A universal life policy has a cumulative “premium catch-up provision” in which the coverage is guaranteed to remain in force as long as a stipulated premium is paid each year, and if the insured is paying less than is required to maintain the guarantee, there is an unlimited right to make up past premium deficiencies.

Model #830 requires that “when a policy contains more than one secondary guarantee, the minimum reserve shall be the greatest of the respective minimum reserves at that valuation date of each unexpired secondary guarantee, ignoring all other secondary guarantees.” Since secondary guarantees with “catch-up” provisions are capable of being reinstated up to the end of the secondary guarantee period, they constitute “unexpired secondary guarantees” which must be incorporated into the calculation of “the greatest of the respective minimum reserves at that valuation date of each unexpired secondary guarantee, ignoring all other secondary guarantees.”

The basic and deficiency reserves for a secondary guarantee with a catch-up provision should be computed as if the stipulated premium requirement had been met. The basic reserve shall be reduced by the product of (a) the “catch-up amount,” if any, which would be required on the valuation date and (b) the ratio of the “initial” (i.e., before adjustment) basic reserve to the sum of the “initial” basic and deficiency reserves. In no event shall the “reduced” basic reserve be reduced below zero. The deficiency reserve shall be reduced by the product of (a) the “catch-up amount,” if any, which would be required on the valuation date and (b) the ratio of the “initial” deficiency reserve to the sum of the “initial” basic and deficiency reserves. In no event shall the “reduced” deficiency reserve be reduced below zero.

If a universal life policy with a “premium catch up provision” has a shadow account below the level necessary to maintain the secondary guarantee, then the reserve for the secondary guarantee shall be valued according to this example. The basic and deficiency reserves, before deduction for the catch-up amount, shall be calculated as specified in Section 8A, Section 8B, Section 8C or Section 8E, as applicable.

- 8A. For policies and certificates issued prior to July 1, 2005: A universal life policy guarantees the coverage to remain in force as long as the accumulation of premiums paid satisfies the secondary guarantee requirement.

First, the minimum gross premiums (determined at issue) that will satisfy the secondary guarantee requirement must be derived.

Second, for purposes of applying Sections 7B and 7C of Model #830, the “specified premiums” are the minimum gross premiums derived in “Step One.”

Third, a determination should be made of the amount of actual premium payments in excess of the minimum gross premiums. For policies utilizing shadow accounts, this will be the amount of the shadow account. For policies with no shadow accounts but which specify cumulative premium requirements, this excess will be the amount of the cumulative premiums paid in excess of the cumulative premium requirements; the cumulative premium payments and requirements should include any interest credited under the secondary guarantee (with interest credited at the rate specified under the secondary guarantee).

Fourth, a determination should be made of the single payment necessary at the valuation date to fully fund the remaining secondary guarantee assuming that the minimum gross premiums have been paid, up through the valuation date, during the secondary guarantee period. The result from “Step Three” should be divided by this number.

Fifth, compute the net single premium on the valuation date for the coverage provided by the secondary guarantee for the remainder of the secondary guarantee period, using any valuation table and select factors authorized in Section 5A of Model #830.

Sixth, the “net amount of additional premiums” is determined by multiplying the ratio from “Step Four” by the difference between the net single premium from “Step Five” and the basic and deficiency reserve, if any, computed in “Step Two.”

Seventh, a “reduced deficiency reserve” should be computed by multiplying the deficiency reserve, if any, by the one minus the ratio from “Step Four,” but not less than zero. This “reduced deficiency reserve” is the deficiency reserve to be used for purposes of Section 7D(1) of Model #830.

Eighth, the actual reserve used for purposes of Section 7D(1) of Model #830 is the lesser of: (1) the net single premium from “Step Five,” and (2) the amount of the excess from “Step Six” plus the basic reserve and the deficiency reserve, if any, computed in “Step Two.” Reduce this result by the applicable policy surrender charges, i.e., the account value less the cash surrender value. If the resulting amount is less than the sum of the basic and deficiency reserve from Step Two, then the basic and deficiency reserves to be used for the purposes of Section 7D(1) are those calculated in Step Two, and no further calculation is required.

Ninth, an “increased basic reserve” should be computed by subtracting the “reduced deficiency reserve” in “Step Seven” from the reserve computed in “Step Eight.” This “increased basic reserve” is the basic reserve to be used for purposes of Section 7D(1) of Model #830.

- 8B. For policies and certificates issued on or after July 1, 2005 and on or prior to December 31, 2006: A universal life policy guarantees the coverage to remain in force as long as the accumulation of premiums paid satisfies the secondary guarantee requirement.

First, the minimum gross premiums (determined at issue) that will satisfy the secondary guarantee requirement must be derived.

Second, for purposes of applying Sections 7B and 7C of Model #830, the “specified premiums” are the minimum gross premiums derived in “Step One.” Consistent with Model #830, the remaining steps in this guideline should be calculated on a segmented basis, using the segments that Model #830 defines for the product. Therefore, in the remaining steps, the term “fully fund the guarantee” should be interpreted to mean fully funding the guarantee to the end of each possible segment. The term “remainder of the secondary guarantee period” should be interpreted to mean the remainder of each possible segment. The total reserve should equal the greatest of all possible segmented reserves.

Third, a determination should be made of the amount of actual premium payments in excess of the minimum gross premiums. For policies utilizing shadow accounts, this will be the amount of the shadow account. For policies with no shadow accounts but which specify cumulative premium requirements, this excess will be the amount of the cumulative premiums paid in excess of the cumulative premium requirements; the cumulative premium payments and requirements should include any interest credited under the secondary guarantee (with interest credited at the rate specified under the secondary guarantee).

Fourth, as of the valuation date for the policy being valued, for policies utilizing shadow accounts, determine the minimum amount of shadow account required to fully fund the guarantee. For policies with no shadow accounts but which specify cumulative premium requirements, determine the amount of the cumulative premiums paid in excess of the cumulative

premium requirements that would result in no future premium requirements to fully fund the guarantee; the cumulative premium payments and requirements should include any interest credited under the secondary guarantee (with interest credited at the rate specified under the secondary guarantee). For any policy for which the secondary guarantee can not be fully funded in advance, solve for the minimum sum of any possible excess funding (either the amount in the shadow account or excess cumulative premium payments depending on the product design) and the present value of future premiums (using the maximum allowable valuation interest rate and the minimum mortality standards allowable for calculating basic reserves) that would fully fund the guarantee. The amount determined above for this step is to then be divided by one minus a 7% premium load allowance (0.93). The result from “Step Three” should be divided by this number, with the resulting ratio capped at 1. The ratio is intended to measure the level of prefunding for a secondary guarantee which is used to establish reserves. Assumptions within the numerator and denominator of the ratio therefore must be consistent in order to appropriately reflect the level of prefunding. The denominator is allowed to be inconsistent only by the amount of the premium load allowance as defined in this step. As used here, “assumptions” include any factor or value, whether assumed or known, which is used to calculate the numerator or denominator of the ratio.

[DRAFTING NOTE: The 7% premium load allowance approximates an average premium load level as evidenced by policies currently sold in the market. Rather than have the funding ratio vary according to the actual policy loads (which can fluctuate greatly by company and product), all companies will use an identical premium load allowance at a level approximately equal to the current industry average.]

Fifth, compute the net single premium on the valuation date for the coverage provided by the secondary guarantee for the remainder of the secondary guarantee period, using any valuation table and select factors authorized in Section 5A of Model #830.

Sixth, the “net amount of additional premiums” is determined by multiplying the ratio from “Step Four” by the difference between the net single premium from “Step Five” and the basic and deficiency reserve, if any, computed in “Step Two.”

Seventh, a “reduced deficiency reserve” should be computed by multiplying the deficiency reserve, if any, by the one minus the ratio from “Step Four,” but not less than zero. This “reduced deficiency reserve” is the deficiency reserve to be used for purposes of Section 7D(1) of Model #830.

Eighth, the actual reserve used for purposes of Section 7D(1) of Model #830 is the lesser of: (1) the net single premium from “Step Five,” and (2) the amount of the excess from “Step Six” plus the basic reserve and the deficiency reserve, if any, computed in “Step Two.” Reduce this result by the applicable policy surrender charges, i.e., the account value less the cash surrender value. Multiply this surrender charge by the ratio of the net level premium for the secondary guarantee period divided by the net level premium for whole life insurance. Calculate both net premiums using the maximum allowable valuation interest rate and the minimum mortality standards allowable for calculating basic reserves. However, if no future premiums are required to support the guarantee period being valued, there is no reduction for surrender charges. If the resulting amount is less than the sum of the basic and deficiency reserve from Step Two, then the basic and deficiency reserves to be used for the purposes of Section 7D(1) of Model #830 are those calculated in Step Two, and no further calculation is required.

Ninth, an “increased basic reserve” should be computed by subtracting the “reduced deficiency reserve” in “Step Seven” from the reserve computed in “Step Eight.” This “increased basic reserve” is the basic reserve to be used for purposes of Section 7D(1) of Model #830.

- 8C. For all policies and certificates issued on or after January 1, 2007 and on or prior to December 31, 2012: A universal life policy guarantees the coverage to remain in force as long as the accumulation of premiums paid satisfies the secondary guarantee requirement.

First, the minimum gross premiums (determined at issue) that will satisfy the secondary guarantee requirement must be derived.

Second, for purposes of applying Sections 7B and 7C of Model #830, the “specified premiums” are the minimum gross premiums derived in “Step One.” Consistent with Model #830, the remaining steps in this guideline should be calculated on a segmented basis, using the segments that Model #830 defines for the product. Therefore, in the remaining steps, the term “fully fund the guarantee” should be interpreted to mean fully funding the guarantee to the end of each possible segment. The term “remainder of the secondary guarantee period” should be interpreted to mean the remainder of each possible segment. The total reserve should equal the greatest of all possible segmented reserves. Additionally, for purposes of applying Sections 7B and 7C of Model #830, a lapse rate of no more than 2% per year for the first 5 years, followed by no more than 1% per year to the policy anniversary specified in the following table based on issue age, and 0% per year thereafter may be used. If the duration in the table is less than 5, then a lapse rate of no more than 2% per year may be used through that duration, and 0% per year thereafter.

Issue Age	Duration
0-50	30 th policy anniversary
51-60	Policy anniversary age 80
61-70	20 th policy anniversary
71-89	Policy anniversary age 90
90 and over	No lapse

Third, a determination should be made of the amount of actual premium payments in excess of the minimum gross premiums. For policies utilizing shadow accounts, this will be the amount of the shadow account. For policies with no shadow accounts but which specify cumulative premium requirements, this excess will be the amount of the cumulative premiums paid in excess of the cumulative premium requirements; the cumulative premium payments and requirements should include any interest credited under the secondary guarantee (with interest credited at the rate specified under the secondary guarantee).

Fourth, as of the valuation date for the policy being valued, for policies utilizing shadow accounts, determine the minimum amount of shadow account required to fully fund the guarantee. For policies with no shadow accounts but which specify cumulative premium requirements, determine the amount of the cumulative premiums paid in excess of the cumulative premium requirements that would result in no future premium requirements to fully fund the guarantee; the cumulative premium payments and requirements should include any interest credited under the secondary guarantee (with interest credited at the rate specified under the secondary guarantee). For any policy for which the secondary guarantee can not be fully funded in advance, solve for the minimum sum of any possible excess funding (either the amount in the shadow account or excess cumulative premium payments depending on the product design) and the present value of future premiums (using the maximum allowable valuation interest rate and the minimum mortality standards allowable for calculating basic reserves) that would fully fund the guarantee. The amount determined above for this step is to then be divided by one minus a 7% premium load allowance (0.93). The result from “Step Three” should be divided by this number, with the resulting ratio capped at 1. The ratio is intended to measure the level of prefunding for a secondary guarantee which is used to establish reserves. Assumptions within the numerator and denominator of the ratio therefore must be consistent in order to appropriately reflect the level of prefunding. The denominator is allowed to be inconsistent only by the amount

of the premium load allowance as defined in this step. As used here, “assumptions” include any factor or value, whether assumed or known, which is used to calculate the numerator or denominator of the ratio.

[DRAFTING NOTE: The 7% premium load allowance approximates an average premium load level as evidenced by policies currently sold in the market. Rather than have the funding ratio vary according to the actual policy loads (which can fluctuate greatly by company and product), all companies will use an identical premium load allowance at a level approximately equal to the current industry average.]

Fifth, compute the net single premium on the valuation date for the coverage provided by the secondary guarantee for the remainder of the secondary guarantee period, using any valuation table and select factors authorized in Section 5A of Model #830. For purposes of calculating the net single premium, a lapse rate subject to the same criteria as the lapse rate used in applying Step 2 of 8C above may be used.

Sixth, the “net amount of additional premiums” is determined by multiplying the ratio from “Step Four” by the difference between the net single premium from “Step Five” and the basic and deficiency reserve, if any, computed in “Step Two.”

Seventh, a “reduced deficiency reserve” should be computed by multiplying the deficiency reserve, if any, by the one minus the ratio from “Step Four,” but not less than zero. This “reduced deficiency reserve” is the deficiency reserve to be used for purposes of Section 7D(1) of Model #830.

Eighth, the actual reserve used for purposes of Section 7D(1) of Model #830 is the lesser of: (1) the net single premium from “Step Five,” and (2) the amount of the excess from “Step Six” plus the basic reserve and the deficiency reserve, if any, computed in “Step Two.” Reduce this result by the applicable policy surrender charges, i.e., the account value less the cash surrender value. Multiply this surrender charge by the ratio of the net level premium for the secondary guarantee period divided by the net level premium for whole life insurance. Calculate both net premiums using the maximum allowable valuation interest rate and the minimum mortality standards allowable for calculating basic reserves. If the resulting amount is less than the sum of the basic and deficiency reserve from Step Two, then the basic and deficiency reserves to be used for the purposes of Section 7D(1) of Model #830 are those calculated in Step Two, and no further calculation is required.

Ninth, an “increased basic reserve” should be computed by subtracting the “reduced deficiency reserve” in “Step Seven” from the reserve computed in “Step Eight.” This “increased basic reserve” is the basic reserve to be used for purposes of Section 7D(1) of Model #830.

Business reserved pursuant to Section 8C must be supported by an asset adequacy analysis specific to this business. This asset adequacy analysis must be performed pursuant to the requirements of Section 3 of the Standard Valuation Law. Reserves required by Section 8C shall be increased by any additional reserves required by the asset adequacy analysis.

8D. This Section 8D applies to policies and certificates (1) issued on and after July 1, 2005, (2) issued prior to January 1, 2013, and (3) in force on December 31, 2012, or on any valuation date thereafter: Under a universal life policy with a secondary guarantee, the coverage is guaranteed to remain in force as long as the accumulation of premiums paid satisfies the secondary guarantee requirement.

Notwithstanding the requirements of any of the other sections of this Actuarial Guideline (and in addition to any testing that may be required under Section 8C), this Section 8D describes the

reserving requirements with respect to universal life with secondary guarantee products, with or without a shadow account, with multiple sets of interest rate or other credits, or multiple sets of cost of insurance, expense, or other charges that may become applicable to the calculation of the secondary guarantee measures in any one policy year. This Section 8D does not apply if the minimum gross premiums for the policies are determined by applying the set of charges and credits that produces the lowest premiums, regardless of the imposition of constraints, contingencies, or conditions that would otherwise limit the application of those credits and charges. The requirements of this Section 8D apply to a company on December 31, 2012, and on any subsequent valuation date if (1) on the applicable date, the in force face amount (direct plus assumed) of universal life insurance to which this Section 8D would otherwise apply exceeds 2% of the company's face amount of individual permanent life insurance in force, or (2) on the applicable date, the company's face amount of insurance in force subject to this Section 8D exceeds \$1,000,000,000 (one billion dollars). Any company otherwise meeting these criteria may seek an exemption to the requirements under this Section 8D by filing an exemption request with its state of domicile, which will provide a copy of the request to the NAIC Financial Analysis (E) Working Group (FAWG). If the state of domicile agrees with the exemption request, then the requirements of this Section 8D do not apply to such company, provided FAWG does not conclude that the exemption would allow the company to use a reserving methodology that is not appropriate in relation to the benefits and the pattern of premiums for the plans covered.

a. Primary Reserve Methodology

The company's aggregate gross reserve before reinsurance for the business subject to this Section 8D to be reported in the December 31, 2012, and subsequent annual statutory financial statements of the company will be the aggregate reserve under 1 below, plus any excess of the aggregate reserve determined as defined in 2 below, over 1:

1. The basic and deficiency reserve as of the valuation date determined by the company according to the reserve methodology and assumptions used by the company for the statutorily-reported reserve for the business subject to this Section 8D as of December 31, 2011.
2. The reserve amount as of the valuation date determined according to the same requirements for determining the deterministic reserve in the version of the *Valuation Manual* specified under Section 11 of the *Standard Valuation Law* (Model #820) and adopted by the NAIC to govern the principle-based valuation on the valuation date, but with the two modifications identified below, determined as follows:
 - a) First, future year-by-year cash flows for the block of business subject to this Section 8D are projected as of the valuation date. In making this projection:
 - (I) the projected net investment earnings from the starting assets shall be the lesser of (i) the actual portfolio net investment returns and (ii) net investment returns based on a portfolio of A-rated corporate bonds purchased in the year of issue of the policies based on yields available in the year of issue for those bonds.
 - (II) the projected net investment rate for the reinvestment assets shall be the lesser of (i) the average over a period of 12 months, ending on the June 30 prior to the valuation date, of the monthly average of the composite yield on seasoned corporate bonds, as published by Moody's Investor Services, Inc. and (ii) 7% per annum.

- b) Second, future year-by-year net investment returns are determined from the cash flows generated in Section 8D(a)(2)(a).
- c) Third, the reserve for the policies is computed using the year-by-year net investment returns determined in Section 8D(a)(2)(b) to discount the cash flows applicable to those policies.

The company may calculate the reserves as of any December 31 as of a date no earlier than three months before that December 31 valuation date, using relevant company data, provided an appropriate method is used to adjust those reserves to the valuation date.

If the aggregate reserve determined pursuant to the second calculation above exceeds the aggregate reserve determined pursuant to the first calculation, the additional reserve to be held is deemed to be required pursuant to Model #820, Section 3 and Section 6, which provide for an analysis of reserves pursuant to an asset adequacy analysis with margins for moderately adverse assumptions. Any such excess shall be allocated to each policy in proportion to the Step 1 reserve for that policy.

b. Alternative Reserve Methodology

The requirements of subsection a. above shall not apply to a company that holds a total gross reserve amount, before reinsurance, for the business subject to this Section 8D at least equal to the total reserve determined in accordance with the November 1, 2011 Life Actuarial (A) Task Force Statement on Actuarial Guideline XXXVIII, except that for purposes of determining any deficiency reserves under Model #830, using mortality and lapse assumptions according to the same requirements for determining the deterministic reserve in the *Valuation Manual*.

c. Documentation and Reporting

Under the direction of one or more qualified actuaries, the company shall prepare a stand-alone Actuarial Memorandum covering the reserve analysis performed on the business described in this Section 8D in compliance with Section 7 of the *Actuarial Opinion and Memorandum Regulation* (Model #822) to document the assumptions, analyses and results of the reserve calculations described above. The Actuarial Memorandum shall be prepared regardless of whether the company used the Primary Reserve Methodology described in Section 8D(a) or the Alternative Reserve Methodology described in Section 8D(b). Documentation in the submitted Actuarial Memorandum must be sufficient for another actuary qualified in the same practice area to evaluate the assumptions, analyses and results, and to enable regulatory review and verification that the assumptions, analyses and results satisfy the requirements described above, as they relate to the company. In the event that the *Valuation Manual* is incomplete or unclear as to any matter, the actuary preparing the Actuarial Memorandum shall use his or her best judgment in applying the requirements of the *Valuation Manual* and shall document his or her decisions in the Actuarial Memorandum. For any business subject to this Section 8D that has been ceded by the company, the Actuarial Memorandum shall provide a listing of the assuming companies with face amount, reserve credit taken, and form of reinsurance for such business. The Actuarial Memorandum shall be submitted to the state of domicile of the company by the April 30 following the valuation date.

For reporting years prior to 2015: The state of domicile shall provide a copy of the Actuarial Memorandum to FAWG and, upon request, to any other state in which the company is licensed.

For reporting years 2015 and after: The state of domicile shall provide a copy of the Actuarial Memorandum to FAWG upon request and, upon request, to any other state in which the company is licensed.

For those companies that used the Primary Reserve Methodology described above, the Actuarial Memorandum shall also provide with respect to the business subject to this Section 8D a description of the simplifications, approximations and modeling efficiency (aggregation) techniques used to calculate the reserve amount set forth in Subsection 2 of the Primary Reserve Methodology (i.e., Section 8D(a)(2)) and a clear indication that, upon request, information may be obtained that is adequate to permit the audit of any subgroup of the aggregated reserve amounts to ensure that the total of the seriatim (policy-by-policy) reserve calculations produces a reserve not materially different than the aggregated reserve amount determined pursuant to Subsection 2 of the Primary Reserve Methodology (i.e., Section 8D(a)(2)).

Along with the filing of the Actuarial Memorandum pertaining to the December 31, 2012 valuation date, those companies using the Primary Reserve Methodology above shall also submit a report to its state of domicile indicating what the gross reserve before reinsurance for the business subject to this Section 8D would be as of December 31, 2012 if the reserve had been determined pursuant to the methodology and experience assumptions used to determine the reserve set forth in Subsection 2 of the Primary Reserve Methodology (i.e., Section 8D(a)(2)), except using a net reinvestment return rate assumption not greater than the maximum valuation interest rate for the year of issue of each policy set forth in Model #820. The company shall include in this report what its (i) total adjusted capital and (ii) company action level risk based capital would be if the company held the reserve calculated pursuant to this methodology rather than the reserve actually reported for the applicable business in the annual statement submitted by the company to the NAIC. The report described in this paragraph will be provided by the company to the state of domicile, which will forward a copy to FAWG. Upon request, the state of domicile will also forward a copy of this report to any other state in which the company is licensed. The state of domicile, FAWG, and any other state receiving the report will treat it as containing confidential information. The report is to be provided for informational purposes only, and it is to be considered and used as one additional piece of information to be evaluated in the context of the company's overall financial position.

For reporting years prior to 2015: The domestic state will perform a review of the Actuarial Memorandum in consultation with FAWG to ensure the company's reserve calculations have been performed according to the requirements of this Section 8D.

If:

- the company reports in its financial statements the reserve level required above, adjusted for any phase-in period approved by the company's state of domicile, and
- the company complies with any applicable phase-in period made by the state of domicile with respect to such additional reserves, and
- FAWG agrees with the state of domicile's decisions,

FAWG shall issue a confidential report to non-domiciliary states indicating that the company's reserving methodology is appropriate in relation to the benefits and the pattern of premiums for the plans covered. If FAWG does not agree with the state of domicile's decisions, FAWG shall issue a confidential report to non-domiciliary states indicating that the company's reserving methodology is not appropriate in relation to the benefits and the pattern of premiums for the plans covered.

For reporting years 2015 and after: The domestic state will perform a review of the Actuarial Memorandum to ensure the company's reserve calculations have been performed according to the requirements of this Section 8D and may consult with FAWG regarding this review.

If FAWG does not agree with the state of domicile's decisions, FAWG shall issue a confidential report to non-domiciliary states indicating that the company's reserving methodology is not appropriate in relation to the benefits and the pattern of premiums for the plans covered.

- 8E. For policies and certificates issued on or after January 1, 2013, except for ULSG policies and certificates for which the company elects or is required to apply VM-20 as the reserve standard, per *Valuation Manual* requirements: For a universal life policy or certificate that guarantees the coverage to remain in force as long as the accumulation of premiums paid satisfies the secondary guarantee requirement.

Step 1: The first step is to derive the minimum gross premiums for the policy or certificate (to be determined at issue). Except as indicated for policies and certificates described in Method I Policy Design #3 (described below), the minimum premiums so derived must satisfy the secondary guarantee requirement. Model #830, Section 7A(4) does not apply in determining the minimum gross premiums for policies and certificates described in this Section 8E.

I) Methodology for determining the minimum gross premiums for certain designs ("Method I").

1. Policy Design #1: For a policy containing a secondary guarantee that uses a shadow account with a single set of charges and credits, the minimum gross premium for any policy year is the premium that, when paid into a policy with a zero shadow account value at the beginning of the policy year, produces a zero shadow account value at the end of the policy year, using the guaranteed shadow account charges and credits (e.g., interest credited rate, mortality charges, premium loads and expense charges) specified under the secondary guarantee.
2. Policy Design #2: For a policy that compares paid accumulated premiums to minimum required accumulated premiums (cumulative premium policy), with both accumulations based on a single set of charges and credits specified under the secondary guarantee, the minimum gross premium for any policy year is the premium that, when paid into a policy for which the accumulated premiums equals the minimum required accumulated premiums at the beginning of the policy year, results in the paid accumulated premiums being equal to the minimum required accumulated premiums at the end of the policy year.
3. Policy Design #3: If, for any policy year, a shadow account secondary guarantee, a cumulative premium secondary guarantee design, or other secondary guarantee design, provides for multiple sets of charges and/or credits, then the minimum gross premiums shall be determined by applying the set of charges and credits in that policy year that produces the lowest premiums, ignoring the constraint that such minimum premiums satisfy the secondary guarantee requirement and ignoring any contingencies or conditions that would otherwise limit the application of those charges and credits.

Notwithstanding the language in the approaches described above, the guaranteed (including conditionally guaranteed) policy credits for each year shall be limited as to magnitude in order for minimum gross premiums to be determined consistent with any of the policy designs above. The limitations must be met at the time of each product filing and also when guaranteed credits or charges for each such product are revised. For this purpose, policy credits based on the interest or accumulation rates in the policy shall not exceed the "Index" (defined in the next sentence) plus 3% per annum. The Index used to establish the limitation as to magnitude shall be either (i) the monthly average of the composite yield on seasoned corporate bonds as published by Moody's Investors Service, Inc., for the month immediately preceding the date of the Actuarial Opinion required under this Section 8E and described below, or (ii) the monthly average over a period of twelve months, ending on the June 30 preceding the date of the Actuarial Opinion required below, of the composite yield on seasoned corporate bonds, as published by Moody's Investors Service, Inc. The averaging period chosen by the company must be elected at time of product

filing and consistently used for that product thereafter even if guaranteed credits or charges are subsequently revised for that product.

II) Methodology for determining the minimum gross premiums for other designs (“Method II”).

Unless otherwise provided in this Section 8E, the minimum gross premiums shall be the lowest schedule of premiums that keep the policy in force over the life of the secondary guarantee period and that produce the greatest deficiency reserve at issue. If deficiency reserves produced at issue are all zero, then the smallest absolute value of the difference between “quantity A” set forth in Model #830, Section 5B, over the basic reserve shall be considered the greatest deficiency reserve. For purposes of this Step 1, in deriving the deficiency reserve associated with a particular schedule of gross premiums, the X factors used shall be set equal to 1 for all durations, issue ages, and risk classes.

For policies that use a shadow account, and for cumulative premium policies, the schedule of premiums that keep the policy in force over the life of the secondary guarantee period and that produce the greatest deficiency reserve at issue shall be determined assuming the following premium-paying patterns for premiums actually paid under the policy:

- Level premiums for the life of the secondary guarantee but not beyond the duration that premiums may be paid under the policy, and
- Increasing premiums over the life of the secondary guarantee (including any resulting reserve segments created), but not beyond the durations that premiums may be paid under the policy, and
- Combinations of the above premium patterns including higher initial premiums for funding levels to have access to better charges and credits with combinations of level and increasing premium patterns thereafter.

For all policies and certificates subject to this Step 1 of Method II of this Section 8E, the company shall also perform a good faith high-level analytical review of the product design with respect to the premium payment patterns to be expected with respect to that design. The review should consider whether there are situations whereby the product design is likely to elicit a pattern of premium payments that, if paid, would provide the insured with access to lower charges and/or higher credits than those that would apply assuming the premium paying patterns required to be tested under this Section 8E and thereby result in the need for a deficiency reserve significantly in excess of that determined using the schedules of minimum gross premiums determined pursuant to the premium payment patterns required to be tested under this Section 8E. To the extent identified, the company shall use such other premium payment patterns it determines are likely to result in the need for a greater deficiency reserve than implied by the premium payment patterns required to be tested under this Section 8E in determining the schedule of minimum gross premiums and related deficiency reserve. In performing this analytic review, the company shall consider payment patterns which keep the policy in force over the lifetime of the secondary guarantee.

Step 2: For purposes of applying Section 7B and Section 7C of Model #830, the “specified premiums” are the minimum gross premiums derived in Step 1. Consistent with Model #830, the remaining steps in this guideline should be calculated on a segmented basis, using the segments that Model #830 defines for the product. Therefore, in the remaining steps, the term “fully fund the guarantee” should be interpreted to mean fully funding the guarantee to the end of each possible segment. The term “remainder of the secondary guarantee period” should be interpreted to mean the remainder of each possible segment. The total reserve should equal the greatest of all possible segmented reserves. Additionally, for purposes of applying Section 7B and Section 7C of Model #830, the lapse rate used shall be no more than 2% per year for the first 5 years,

followed by no more than 1% per year to the policy anniversary specified in the following table based on issue age, and 0% per year thereafter. If the duration in the table is less than 5, then a lapse rate of no more than 2% per year may be used through that duration, and 0% per year thereafter.

Issue Age	Duration
0-50	30 th policy anniversary
51-60	Policy anniversary age 80
61-70	20 th policy anniversary
71-89	Policy anniversary age 90
90 and over	No lapse

Step 3: A determination should be made of the amount of actual premium payments greater than or less than the minimum gross premiums. For policies using shadow accounts and qualifying under one of the Policy Designs of Method I, this will be the amount of the shadow account. For policies using shadow accounts whose minimum gross premium is determined under Method II, this will be the amount of the shadow account minus the amount that would be in the shadow account if the minimum gross premiums used to calculate basic and deficiency reserves in Step 2 were paid. This result may be negative. For cumulative premium policies whose minimum gross premiums are determined under Method I, this excess will be the amount of cumulative premiums paid over the cumulative premium requirements. For cumulative premium policies whose minimum gross premiums are determined under Method II, this excess will be the amount of the cumulative premiums paid minus the cumulative premium using the minimum gross premiums used to calculate basic and deficiency reserves in Step 2. This result may be negative. The cumulative premium payments and requirements should include any interest credited under the secondary guarantee (with interest credited at the rate specified under the secondary guarantee).

Step 4: As of the valuation date for the policy being valued, for policies using shadow accounts, determine the minimum amount of shadow account required to fully fund the guarantee. For cumulative premium policies, determine the minimum amount of the cumulative premiums required to fully fund the guarantee less the cumulative premium requirements. For any policy for which the secondary guarantee cannot be fully funded in advance, solve for the minimum sum of any possible excess funding (either the amount in the shadow account or excess cumulative premium payments depending on the product design) and the present value of future premiums (using the maximum allowable valuation interest rate and the minimum mortality standards allowable for calculating basic reserves) that would fully fund the guarantee. For shadow account policies, if the minimum gross premium is determined according to Method II and the Step 3 amount is positive then the amount determined above for this step is reduced by any positive shadow account based on minimum gross premiums. For cumulative premium policies, if the minimum gross premium is determined according to Method II and the Step 3 amount is positive then the amount determined above for this step is reduced by the excess of cumulative premiums, assuming minimum gross premiums are paid, over the cumulative premium requirements. For shadow account policies, if the minimum gross premium is determined according to Method II and the Step 3 amount is negative then the amount determined above for this step is replaced by the amount of the shadow account based on the minimum gross premiums. For cumulative premium policies, if the minimum gross premiums are determined by Method II and the Step 3 amount is negative then the amount determined above for this step is replaced by the excess of cumulative premiums, assuming minimum gross premiums are paid, over the cumulative premium requirements.

The amount determined above for this step is then divided by one minus a 7% premium load allowance (0.93).

The result from Step 3 should be divided by the number above, with the resulting ratio capped at 1 and no less than (-1). The ratio is intended to measure the level of prefunding for a secondary guarantee and is used to establish reserves. Assumptions within the numerator and denominator of the ratio therefore must be consistent in order to appropriately reflect the level of prefunding. The denominator is allowed to be inconsistent only by the amount of the premium load allowance as defined in this step. As used here, “assumptions” include any factor or value, whether assumed or known, that is used to calculate the numerator or denominator of the ratio.

[DRAFTING NOTE: The 7% premium load allowance approximates an average premium load level as evidenced by policies currently sold in the market. Rather than have the funding ratio vary according to the actual policy loads (which can fluctuate greatly by company and product), all companies will use an identical premium load allowance at this 7% level, which is approximately equal to the current industry average.]

Step 5: Compute the net single premium on the valuation date for the coverage provided by the secondary guarantee for the remainder of the secondary guarantee period, using any valuation table and select factors authorized in Section 5A of Model #830. For purposes of calculating the net single premium, a lapse rate subject to the same criteria as the lapse rate used in applying Step 2 may be used.

Step 6: If the amount in Step 3 is positive the “net amount of additional premiums” is determined by multiplying the ratio from Step 4 by the difference between the net single premium from Step 5 and the basic and deficiency reserve, if any, computed in Step 2.

If the amount in Step 3 is negative, the “net amount of additional premiums” is determined by multiplying the ratio from Step 4 by the basic reserves, if any, computed in Step 2. This result will be negative or zero. Subtract the deficiency reserve calculated in Step 2 from this result and then add the following amount, depending on whether the policy is a shadow account policy or a cumulative premium policy:

- a) If a shadow account policy add the following:
The deficiency reserve at issue calculated using X factors associated with the premium paying pattern used in determining the greatest deficiency reserve in Method II, Step 1, multiplied by one minus the ratio of the amount of the shadow account divided by minimum amount in the shadow account that would fully fund the guarantee. This amount in Step 6(a) is not to be less than zero.
- b) If a cumulative premium policy add the following:
The deficiency reserve at issue calculated using X factors associated with the premium paying pattern used in determining the greatest deficiency reserve in Method II, Step 1, multiplied by one minus the ratio of the amount of cumulative premiums paid divided by the minimum amount of cumulative premiums required to fully fund the guarantee. This amount in Step 6(b) is not to be less than zero.

Step 7: A “reduced deficiency reserve” shall be computed by multiplying the deficiency reserve, if any, by one minus the ratio (such ratio not to be set less than zero) from Step 4; this final amount also not to be set less than zero. This “reduced deficiency reserve” is the deficiency reserve to be used for purposes of Section 7D(1) of Model #830.

Step 8: The reserve used for purposes of Model #830, Section 7D(1), is as follows.

- a) Take the lesser of:
 - 1) the “net amount of additional premiums” from Step 6 plus the basic reserve and the deficiency reserve, if any, computed in Step 2, and
 - 2) the net single premium from Step 5.

- b) Reduce the result in Step 8(a) by the applicable policy surrender charges (i.e., the account value less the cash surrender value). Multiply this surrender charge by the ratio of the net level premium for the secondary guarantee period divided by the net level premium for whole life insurance. Calculate both net premiums using the maximum allowable valuation interest rate and the minimum mortality standards allowable for calculating basic reserves.

- c) Calculate the reserve floor:
 - 1) If the result in Step 3 is negative, then the reserve floor shall equal the sum of the Step 2 basic and deficiency reserves and the amount from Step 6.
 - 2) If the result in Step 3 is not negative, then the reserve floor shall equal the sum of the Step 2 basic and deficiency reserves without any adjustment.

The reserve to be used for purposes of Model #830, Section 7D(1) is the greater of the resulting amount from Step 8(b) above and the reserve floor.

Step 9: An “increased basic reserve” shall be computed by subtracting the “reduced deficiency reserve” in Step 7 from the reserve computed in Step 8. This “increased basic reserve” is the basic reserve to be used for purposes of Model #830, Section 7D(1).

Actuarial Opinion and Company Representation Requirements

If a company uses one of the Policy Design methodologies described above in Method I of this Section 8E to determine the minimum gross premiums in Step 1, the company shall submit to its state of domicile at the time of filing/approval of a new product, or by December 31, 2012, for current products that will be issued in 2013 or thereafter, and at any time when rates and/or charges are changed, an Actuarial Opinion signed by the Appointed Actuary and a Representation of the Company signed by a Senior Officer of the company regarding the applicable policy form(s) that states:

Actuarial Opinion

“I, (name and professional designation), am the appointed actuary for (company name). I have examined the actuarial assumptions and actuarial methods used in determining the reserves described herein, and, in my opinion: (1) the product referenced herein meets the definition of Policy Design # ___ described in Method I in Section 8E of Actuarial Guideline XXXVIII (AG 38); (2) notwithstanding the language in Policy Design # ___, the guaranteed (including conditionally guaranteed) policy credits in the product available for any year do not exceed the “Index” defined in Method I in Section 8E of AG 38 plus 3% per annum; and (3) the minimum gross premiums determined under Policy Design # ___ are not inconsistent with the minimum premiums, charges and credits that are expected to apply under the policy.”

(Name of actuary, printed or typed)
 (Signature of actuary)
 (Date signed)

Company Representation

“(company name) hereby represents: (1) that the product referenced herein meets the definition of Policy Design # ___ described in Method I in Section 8E of Actuarial Guideline XXXVIII (AG 38); (2) notwithstanding the language in Policy Design # ___, the guaranteed (including conditionally guaranteed) policy credits in the product available for any year do not exceed the “Index” defined in Method I in Section 8E of AG 38 plus 3% per annum; and (3) the minimum gross premiums determined under Policy Design # ___ are not inconsistent with the minimum premiums, charges and credits that are expected to apply under the policy.”

(Name of company Officer, printed or typed)
(Signature of company Officer)
(Date signed)

For reporting years prior to 2015: The state of domicile shall provide a copy of the Actuarial Opinion and the Company Representation to FAWG and, upon request, to any state in which the company plans to issue the policy that is the subject of the Actuarial Opinion and Company Representation.

For reporting years 2015 and after: The state of domicile shall provide a copy of the Actuarial Opinion and the Company Representation to FAWG, upon request, and, upon request, to any state in which the company plans to issue the policy that is the subject of the Actuarial Opinion and Company Representation.

Policy Design

For reporting years prior to 2015: If a company develops reserves based on Method II of this Section 8E, the company shall submit a report from its Appointed Actuary prior to issuing policies on that form to its state of domicile, which will provide a copy to FAWG and (upon request) to any state in which the company plans to issue the product, that briefly describes the analytical review performed, the company’s conclusions following the analytical review, and whether any additional premium payment patterns other than those required by this Section 8E were tested as a result of the review. If FAWG agrees with the state of domicile’s decisions with respect to the company’s Method II reserving methodology, FAWG shall issue a confidential report to non-domiciliary states indicating that the company’s reserving methodology is appropriate in relation to the benefits and the pattern of premiums for the plans covered. If FAWG does not agree with the state of domicile’s decisions with respect to the company’s Method II reserving methodology, FAWG shall issue a confidential report to non-domiciliary states indicating that the company’s reserving methodology is not appropriate in relation to the benefits and the pattern of premiums for the plans covered.

For reporting years 2015 and after: If a company develops reserves based on Method II of this Section 8E, the company shall submit a report from its Appointed Actuary prior to issuing policies on that form to its state of domicile, which will provide a copy to FAWG, upon request, and (upon request) to any state in which the company plans to issue the product, that briefly describes the analytical review performed, the company’s conclusions following the analytical review, and whether any additional premium payment patterns other than those required by this Section 8E were tested as a result of the review. If FAWG does not agree with the state of domicile’s decisions with respect to the company’s Method II reserving methodology, FAWG shall issue a confidential report to non-domiciliary states indicating that the company’s reserving methodology is not appropriate in relation to the benefits and the pattern of premiums for the plans covered.

Effective Date

With the exception of Steps 3 through Step 9 of Section 8A and all of Section 8B, Section 8C, Section 8D and Section 8E, the scope of this guideline shall be inclusive of policies issued on and after the earlier of a state's adoption of the revised Model #830 (adopted by the NAIC in March 1999) or the statutory accounting practices and procedures as set forth in the NAIC *Accounting Practices and Procedures Manual*. All of Section 8A, Section 8B, Section 8C, Section 8D and Section 8E shall be applicable to policies and certificates issued on or after the later of the date of a state's adoption of the revised Model #830 and January 1, 2003, subject to the dates and/or applicable scope specified in Section 8A, Section 8B, Section 8C, Section 8D and Section 8E.

Actuarial Guideline XXXIX

RESERVES FOR VARIABLE ANNUITIES WITH GUARANTEED LIVING BENEFITS

Actuarial Guideline XXXIX sunset on December 30, 2009, and was replaced by *Actuarial Guideline XVIII—CARVM for Variable Annuities*, effective December 31, 2009.

Not for Distribution

Actuarial Guideline XL

GUIDELINE FOR VALUATION RATE OF INTEREST FOR FUNDING AGREEMENTS AND GUARANTEED INTEREST CONTRACTS (GICS) WITH BAIL-OUT PROVISIONS

PURPOSE

The purpose of this Guideline is to interpret the Standard Valuation Law (SVL) for assignment of appropriate valuation interest rates to risks embedded in bail-out provisions under Funding Agreements and Guaranteed Interest Contracts.

BACKGROUND

Funding Agreements (FAs) and other types of Guaranteed Interest Contracts (GICs) typically issued to tax-exempt municipal bonds, money market funds and securities lending funds, often contain bail-out provisions that allow the contractholders to get their money back at full book value. Such provisions may be triggered by the credit rating downgrade of the issuer below a given level or may be at a given period's notice to the contractholder, e.g. 7, 30, 90 or 180 days' notice. The contract language for these provisions may be as follows:

1. In the event that the investment provider (i.e. the insurance company) is downgraded below *A-/A3* by S & P and/or Moody's respectively, the contract holder has the right to terminate the contract and receive the remaining principal and accrued interest without penalty. [In most cases the issuer has the alternate option to provide a replacement contract or post collateral or do a credit wrap.]
2. Each party has the right to terminate the contract before maturity by giving the other at least *7/30/90 or 180-days* notice in writing. At such termination the principal and accrued interest is payable with no penalty.

Contracts with downgrade provision

The bulk of the contracts issued with a downgrade provision are fixed rate FAs or GICs issued in connection with tax-exempt municipal bonds. These contracts can be short-term or long-term. Short-term contracts typically have an average life of around one-year, and are intended for municipal bond funds for construction, acquisition, housing, tax revenue anticipation notes (TRANS), etc. In these types of funds the cash-flow projections are provided when the case is underwritten, but there may be variability in the actual withdrawals. Any outstanding principal and interest is payable at maturity.

Long-term contracts are issued in connection with the debt service reserve (DSR) or the float fund of the bond issue, and mature at the same time as the bonds, which can be as long as 30 years. The float fund takes in deposits, and pays out the half-yearly interest and principal (if any is due) on the bonds. It runs to near zero about twice a year, after each half-yearly coupon payment. The DSR is a contingent fund for a rainy day to prevent a missed coupon or principal payment on the bond. The DSR has a single deposit that is typically 10% of the bond issue.

Contracts with put provision

FAs or GICs with put provisions are generally issued to money market funds subject to Rule 2a-7 of the Investment Company Act. Rule 2a-7 provides guidelines on liquidity, requiring funds available at book value subject to certain notification periods. Additionally, these contracts usually have downgrade provisions. Even if the downgrade provision is not in the contract, it can be assumed that the put will be exercised on downgrade, since a certain level of credit is also a Rule 2a-7 requirement.

Typically, these FAs or GICs guarantee a floating rate of interest linked to an index like LIBOR, which is paid out and reset periodically. Most contracts have fixed maturity dates when the principal is returned. Generally the FAs or GICs are the higher yielding assets of the money market funds, and therefore puts are not expected to be exercised.

Risks

Both the downgrade and the put provisions present liquidity or concentration type of risks to the issuer, i.e. if a critical event occurs, a substantial part of the whole block of business is likely to be liquidated. Sufficient asset liquidity, prudent A/L management, cash flow testing, hedging strategies, etc. can mitigate these risks. Also, companies generally have contractual provisions providing alternative options.

Downgrade provision:

The main risk here is that, upon downgrade to the trigger level, a company may have to realize its assets at a market loss in order to pay out at book. If the downgrade happens in a falling interest rate environment there is no risk of a market loss as the underlying assets are likely to be at a higher market value. On the other hand if the downgrade occurs in a rising interest rate environment, market value losses would occur when the company sells assets to pay out liabilities at book value.

Companies have written provisions in their contracts that provide alternate options to paying at book value in a rising interest rate environment:

“Novation/Assignment” option: The novation/assignment option allows the company to transfer its liabilities to another funding agreement provider that meets the credit rating requirements of the contractholder. In a rising interest rate environment, the new provider should be willing to pay a “premium” to assume a liability crediting a below market interest rate. In a perfectly efficient market this “premium” should precisely offset the market value loss upon the sale of the asset. In practice, however, it is less likely that the “premium” would fully offset the market value loss since:

- The new provider may view the liability risk somewhat differently
- The new provider may try and take advantage of the situation of the downgraded company
- There may be a large volume of these types of contracts in the market, etc.

However, the “premium” payable by the new provider could provide a substantial offset against the market value loss incurred by the downgraded company.

“Collateralization” option: This option allows the company to post assets as collateral for the benefit of the contractholder, as an alternative to payment at book value. The collateral posted would have to meet the credit requirements of the contractholder, which could be government or agency securities. Usually the collateral posted is required to have a cushion, typically ranging from 102% to 105%.

Upon trigger of the downgrade provision, the company would need to have suitable assets in its portfolio that are available for use as collateral, and also acceptable to the contractholder. In addition, there will be administrative and custodial expenses/fees of establishing and monitoring collateral levels. In some states there may also be legal restrictions on encumbering assets that back policyholder claims.

If the downgraded company can overcome the above constraints, then collateralization is another alternative of maintaining the contract and not having to pay out at book value.

“Credit Wrap” option: Under this arrangement the contract is issued out of a separate account which is guaranteed by a financial guarantee insurer. Effectively, the credit rating of the guarantor passes through to meet the credit requirement of the FA or GIC. [A number of FAs or GICs requiring a higher credit rating are currently being written in this way.]

The contract being wrapped has to meet certain criteria before the financial guarantee insurers are willing to wrap. Generally, the guarantor would also require higher credit rated securities in the separate account, which could be government or agency, and would require these in the 102% to 105% range. There will also be administrative and custodial expenses of establishing and monitoring the separate account in addition to the wrap fee payable to the mono-line insurer.

Although at significant cost, this option does provide the downgraded company a viable alternative to paying out at book value.

Put provision:

The put provision is not tied to a particular event but can contractually be exercised by giving the required days' notice. It has been argued that this provision is there to meet the Rule 2a-7 liquidity requirements and in practice is unlikely to be exercised, particularly since the FAs or GICs are one of the higher yielding assets of the money market portfolio. However, it is a contractual option and if, for example, the issuer were in financial difficulties, it will be exercised. Past experience suggests this is the case.

The put provision therefore presents a liquidity or concentration risk similar to that of downgrade—it is likely to be exercised in bulk upon happening of a critical event. Similar considerations apply, i.e. in a rising interest rate environment market value losses would occur when the company sells assets to pay out liabilities at book value.

Reserves

For reserving the Standard Valuation Law applies. However, when the SVL was enacted, these types of bail-out provisions did not exist, and were therefore not addressed explicitly. The purpose of this Guideline is to interpret the SVL for assignment of appropriate valuation interest rates to risks embedded in these bail-out provisions.

Other Actuarial Guidelines have provided similar interpretations. For example, Guideline XIII addresses interest bailout provisions under annuity contracts, Guideline XXX provides for participant directed withdrawal provisions under GICs, and Guideline XXXIII covers the elective and non-elective benefits under individual annuity contracts.

Plan Types

The SVL utilizes a concept known as Plan Type, which was designed to distinguish between the various levels of disintermediation risks—the greater the disintermediation risk for a company, the more conservative is the resulting valuation rate. Plan Types designated in the model SVL are defined as follows:

Plan Type A: At any time policyholder may withdraw funds only (1) with an adjustment to reflect changes in interest rates or asset values since receipt of the funds by the insurance company, or (2) without such adjustment but in installments over five years or more, or (3) as an immediate life annuity, or (4) no withdrawal permitted.

Plan Type B: Before expiration of the interest rate guarantee, policyholder may withdraw funds only (1) with an adjustment to reflect changes in interest rates or asset values since receipt of the funds by the insurance company, or (2) without such adjustment but in installments over five years or more, or (3) no withdrawal permitted. At the end of interest rate guarantee, funds may be withdrawn without an adjustment in a single sum or installments over less than five years.

Plan Type C: Policyholder may withdraw funds before expiration of interest rate guarantee in a single sum or installments over less than five years either (1) without adjustment to reflect changes in interest

rates or asset values since receipt of the funds by the insurance company, or (2) subject only to a fixed surrender charge stipulated in the contract as a percentage of the fund.

TEXT

For the purpose of the application of the Standard Valuation Law to FAs and GICs, the annuities and GIC valuation interest rates are to be used. The bailout provisions described above shall be treated as a withdrawal by the policyholder at book value, and the underlying contracts shall be classified as Plan Type C.

However, for contracts containing written provisions that allow the insurance company alternate options to paying out at book value, the valuation actuary may use a valuation rate of interest higher than Type C. In no event may the valuation interest rate be greater than that applicable to similar contracts with no put or bailout provisions. If a provision requires over-collateralization and/or use of high credit quality assets, this should be adequately reflected in the reserves.

If a higher interest rate than Type C is used, the valuation actuary must be satisfied and be able to demonstrate that the written provisions substantially reduce the liquidity risk. In addition, the valuation actuary must be satisfied, and should periodically review, that there are other risk management measures in place to reduce the liquidity or concentration risk, taking into consideration at least the following:

- Readily liquidated assets at nil or minimal market-value loss
- Cash-flow testing results
- Standby lines of credit available and other liquidity facilities established
- Hedges in place with liquidity options
- High credit quality assets available for use as collateral.

Not for Distribution

Actuarial Guideline XLI

PROJECTION OF GUARANTEED NONFORFEITURE BENEFITS UNDER CARVM

I. Background

The following is an excerpt from the October 21, 2003, Report of the American Academy of Actuaries' Life Valuation Subcommittee:

Annuity SNFL Impact on Reserves

Per the Standard Valuation Law, Commissioner's Annuity Reserve Valuation Method (CARVM) is:

“the greatest of the respective excesses of the present values, at the date of valuation, of the future guaranteed benefits, *including guaranteed nonforfeiture benefits*, provided for by the contracts at the end of each respective contract year, over the present value, at the date of valuation, of any future valuation considerations derived from future gross considerations, required by the terms of the contract, that become payable prior to the end of the respective contract year.”

Historically the guaranteed nonforfeiture benefit calculation has been determined at issue (e.g. 90 percent of premiums accumulated at three percent interest). The recent change to the Standard Nonforfeiture Law for Individual Deferred Annuities has changed this.

Nonforfeiture Rate

The new Standard Nonforfeiture Law for Individual Deferred Annuities has changed the nonforfeiture rate from being static to being dynamic. Under the old law, the nonforfeiture interest rate was three percent. The revised law bases the nonforfeiture rate on the five-year Constant Maturity Treasury Rate less 125 basis points (bps). The nonforfeiture rate is subject to a minimum of one percent and a maximum of three percent. Additional enhancements include the ability to reset the nonforfeiture rate at a date predetermined in the contract and allowing an additional reduction (offset) for Equity Indexed Annuities.

The nonforfeiture rate can be reset at a date predetermined in the contract (e.g. five years from issue) and based on a formula specified in the contract. The same requirements applicable to the initial rate apply to the re-determined rate.

The revised law allows an additional offset to the nonforfeiture rate for contracts that provide substantive participation in an equity indexed benefit. This offset ranges from 0 bps to 100 bps.

The ability to re-determine the nonforfeiture rate and that the EIA offset may be reevaluated in the future raises some issues with the CARVM calculation.

In doing a CARVM projection, what should be the assumed interest rate? Should the option depend on whether there are re-determination provisions? Should the option depend on whether the product relies on an equity indexed offset?

The Report further states:

The minimum guaranteed interest rate in the contract might be different than the minimum nonforfeiture rate. To the extent that the guaranteed values in the contract are always greater than the minimum nonforfeiture benefits, then the nonforfeiture values do not come into play.

This Guideline specifies how to determine the nonforfeiture interest rate used in determining the minimum nonforfeiture benefits guaranteed under the contract. As noted in the Report, the minimum nonforfeiture benefits may be less the guaranteed values otherwise provided by the contract. Where this is the case, the higher guaranteed values are used in the CARVM calculation, and “the nonforfeiture values do not come into play.”

It should also be noted that requirements for projecting guarantees exist in other regulations and guidelines, such as the specifications in Actuarial Guideline XXXV (“The Application of the Commissioners Annuity Reserve Method to Equity Indexed Annuities”) for projecting equity-indexed guarantees. The specifications of this Guideline are in addition to any other requirements.

II. Scope

This Guideline applies to contracts subject to CARVM and the Standard Nonforfeiture Law for Individual Deferred Annuities (“SNLIDA”).

III. Text

The following assumptions shall be made on the valuation date for purposes of determining the future nonforfeiture interest rate when this rate is not known in advance. For purposes of (B) below, “NI” shall refer to the nonforfeiture interest rate, “VI” shall refer to the valuation interest rate, and “CNI” shall refer to the current nonforfeiture interest rate which will be adjusted for any future durations pursuant to “A” below.

- A. For the period of time during which the additional EIA offset is not known, the additional offset shall be zero.
- B. For the period of time during which the nonforfeiture interest rate is not known,
$$NI = \min [\max \{VI, CNI\}, 3\%]$$

If the redetermination of the nonforfeiture interest rate is based on changes to the value of the underlying index (this will be the five-year Constant Maturity Treasury Rate in the case of the nonforfeiture interest rate), then for purposes of this Guideline it shall be assumed that such rate is not known as of the first date on which the rate may be subject to redetermination.

IV. Applicability

This Guideline is effective December 31, 2006 and affects all contracts issued on or after January 1, 1981.

Actuarial Guideline XLII

THE APPLICATION OF THE MODEL REGULATION PERMITTING THE RECOGNITION OF PREFERRED MORTALITY TABLES FOR USE IN DETERMINING MINIMUM RESERVE LIABILITIES

1. Purpose

The purpose of this Guideline is to provide rules and guidance in the selection of the proper set of mortality rates when a company chooses to use either the 2001 CSO Preferred Class Structure Mortality Table or the 2017 CSO Preferred Class Structure Mortality Table as authorized under a state's requirements.

2. Effective Date and Scope

The 2001 CSO Preferred Class Structure Mortality Table is available for valuation purposes for individual life policy forms (and certain group life products sold to individuals by certificate with premium rates guaranteed from issue for at least two years) for issues as provided by the state's requirements which may be based on the NAIC *Model Regulation Permitting The Recognition of Preferred Mortality Tables for Use in Determining Minimum Reserve Liabilities* (Model #815) and which may use the NAIC *Valuation Manual*.

The 2017 CSO Preferred Class Structure Mortality Table is available for valuation purposes for individual life policy forms (and certain group life products sold to individuals by certificate with premium rates guaranteed from issue for at least two years), for issues as provided by a state's requirements which may use the NAIC *Valuation Manual*.

The applicable CSO Preferred Class Structure Mortality Table is either the 2001 CSO Preferred Class Structure Mortality Table or the 2017 CSO Preferred Class Structure Mortality Table as applicable in context.

3. Definitions

- A. "Anticipated mortality" means the appointed actuary's assumption about the mortality to be experienced in the future on a group of insured lives.
- B. "Appointed actuary" means any individual who is appointed or retained in accordance with the requirements set forth in the Actuarial Opinion and Memorandum Regulation.
- C. "Basic reserves" means reserves calculated in accordance with Section 5 of the Standard Valuation Law.
- D. "Class" means a group of policies under one or more plans of insurance that has similar anticipated mortality, as grouped together by the insurer.
- E. "Credibility" means a measure of the predictive value in a given application that the appointed actuary attaches to a particular body of data (predictive is used here in the statistical sense and not in the sense of predicting the future).
- F. "Deficiency reserves" means the excess over basic reserves, if any, of minimum reserves established in accordance with Section 8 of the Standard Valuation Law.
- G. "Full credibility" means the level at which a particular body of data is assigned full predictive value based on a selected confidence interval.

- H. “Preferred class certification” means the certification required by Section 5 of the Model.
- I. “Underwriting-based justification” means the incorporation of underwriting criteria for use in setting the anticipated mortality assumption.
- J. “Underwriting class” means the insurer’s designation of insureds into a particular premium rate structure, e.g. super preferred, preferred, or standard

4. Selection of Table within the Applicable CSO Preferred Class Structure Mortality Table

VM-20, Section 3C of the *Valuation Manual* contains the requirements governing the set of mortality rates to be used for the purpose of calculating reserves based on the applicable CSO Preferred Class Structure Mortality Table. The election of the applicable CSO Preferred Class Structure Mortality Table is on a policy form and calendar year of issue basis, although once a calendar year cohort of policy forms is placed on the applicable CSO Preferred Class Mortality Structure Table basis, it may not subsequently revert back to the standard applicable CSO basis without the approval of the commissioner. This would be considered a basis change for annual statement reporting purposes. For those calendar years of issue in which a company opts to use the applicable CSO Preferred Class Structure Mortality Table, it must use the entire applicable CSO Preferred Class Structure Mortality Table for the chosen policy forms, i.e. a company may not use the preferred classes from the applicable CSO Preferred Class Structure Mortality Table and use the applicable Standard CSO Mortality Table for the non-preferred class(es). Additionally, if the company sells two similar policy forms in the same market the appointed actuary must use the same version of the table for both forms and may not use the applicable CSO Preferred Class Structure Mortality Table on one and the applicable Standard CSO Mortality Table on the other. A characteristic of this two-form scenario is that preferred lives would be attracted to one form and non-preferred lives would be attracted to the other.

The Model contains a requirement that at the time of election and annually thereafter, except for business valued under the applicable Residual Standard Nonsmoker Table or the applicable Residual Standard Smoker Table, the appointed actuary shall certify that the following tests of sufficiency were passed:

- a. For each class, the present value of death benefits over the next ten years after the valuation date using the anticipated mortality experience without recognition of mortality improvement beyond the valuation date for each class is less than the present value of death benefits using the valuation basic table corresponding to the valuation table being used for that class.
- b. For each class, the present value of death benefits over the future life of the contracts using anticipated mortality experience without recognition of mortality improvement beyond the valuation date for each class is less than the present value of death benefits using the valuation basic table corresponding to the valuation table being used for that class.

In the event that the class does not contain any policies with expiry dates ten or more years into the future, the sufficiency test based on the present value over the future life of the contracts shall be the only test required.

In order to choose the proper set of mortality rates within the applicable CSO Preferred Class Structure Mortality Table and to develop the preferred class certification, the following considerations shall be made:

A. Creation of Classes

The appointed actuary should consider the composition and characteristics of the policies issued under a plan of insurance in determining the appropriate classes that will be applicable under that plan. The policies that comprise classes generally have similar underwriting or mortality experience characteristics. When classes are similar across various plans of insurance, these classes may be combined into a single aggregate class. The appointed actuary shall not combine classes that are expected to have dissimilar anticipated mortality as a means to produce reserves that are materially lower than those developed if the classes were not combined.

The appointed actuary should consider the presence of reinsurance in creating classes. Anticipated mortality should be assessed and classes should be created on a gross basis. To the extent that anticipated mortality on reinsurance ceded or assumed is materially different from that on direct business, the appointed actuary should consider creating separate classes to properly reflect the anticipated mortality.

If, due to differences in actual experience by policy form and underwriting class, groupings of classes are changed from those used in the prior actuarial certifications, the change and the effect of the change shall be disclosed to the commissioner in the actuarial certification.

Separate classes may be established for a single policy form if there are significant anticipated mortality differences for different cohorts of insured lives, such as age groups or policy sizes. For instance, if a company has different underwriting thresholds for policies with face amounts of \$1 million or more, it may be appropriate to have a class for policies with face amounts of less than \$1 million and a separate class for policies of \$1 million or more.

B. Deriving Anticipated Mortality

- i. If relevant company experience for a particular class is available and has full credibility, the appointed actuary shall use that experience as the basis for deriving anticipated mortality.
- ii. In situations where relevant company experience for a particular class is available but does not have full credibility, the appointed actuary shall derive the anticipated mortality by blending the relevant company experience for the class with actual relevant, credible experience and past trends in experience of other similar types of business, either in the same company, in other companies (including reinsurance companies), or from other sources, generally in that order of preference provided that the appointed actuary supplies underwriting-based justification. The blending process shall be based on a credibility methodology that is recognized by the actuarial profession as acceptable practice as provided for in published transactions and scientific journals.
- iii. In situations where relevant company experience for a particular class is not available (e.g. a new product), the appointed actuary may derive the anticipated mortality using actual relevant credible experience and past trends in experience of other similar types of business either in the same company, in other companies (including reinsurance companies), or from other sources, generally in that order

of preference, provided that the appointed actuary supplies underwriting-based justification.

- iv. Underwriting-based justification shall include an analysis of the relationship between the underwriting-based criteria for the class where no experience data is available or does not have full credibility and the underwriting-based criteria that underlie the actual relevant credible experience data.
- v. If no sufficient underwriting-based or experienced-based justification is made to derive anticipated mortality for a class, the company shall not use the applicable CSO Preferred Class Structure Mortality Table for valuation.

C. Periodic Assessment of Anticipated Mortality

The appointed actuary shall annually review relevant emerging experience and underwriting methods for the purpose of assessing the appropriateness of anticipated mortality for each class and, in aggregate, for all classes combined. If the results of statistical or other testing indicate that previously anticipated mortality for a given class is inappropriate, then the appointed actuary shall set a new anticipated mortality assumption for the class. After analyzing the appropriateness of the anticipated mortality for each class, the appointed actuary shall analyze the appropriateness of the anticipated mortality assumptions at the aggregate level. If the analysis at the aggregate level indicates that aggregate anticipated mortality is inadequate, then the appointed actuary shall adjust the anticipated mortality assumption for one or more of the classes until the appointed actuary is satisfied that the anticipated mortality assumptions are adequate at the aggregate level.

D. Tests of Sufficiency

After the anticipated mortality is established, each class must be tested for sufficiency. If a class fails any required sufficiency test, the class must be re-valued using a different set of mortality rates from the applicable CSO Preferred Class Structure Mortality Table. A company must choose a set of mortality rates under which all required tests of sufficiency can be passed.

E. Calculation of Present Value

When a class is tested for sufficiency, the calculation of the present value of death benefits shall be based on a projection of death benefits, without the effect of lapse, at the valuation interest rate used to determine basic reserves for the class. If the class contains policies with several valuation interest rates, the lowest valuation interest rate used to determine the base reserves for any policy within the class shall be used for that class.

F. Right of Commissioner to Change the Table Used by the Company

The commissioner may require a company to change the mortality table if it is determined by the commissioner that inadequate justification of anticipated mortality is provided by the company.

5. Communications and Disclosures

The appointed actuary shall provide to the commissioner an annual certification that, as of the valuation date, the anticipated mortality experience of each class of business (other than Residual Standard Class) meets the criteria of 4(a) and 4(b) above. Additionally, the appointed actuary shall prepare an annual report in support of the certification. The report shall include the following items:

- A. The certification that the report supports;
- B. The specified plans of insurance for which the company has elected to use the Preferred Class Structure Table, briefly describing each plan and the amount of in force business (count, face amount, and reserves) on each plan on the valuation date;
- C. Compliance with the certification criteria;
- D. Description of sources of information used as a basis for determining anticipated mortality;
- E. Analysis performed to evaluate the credibility of relevant historical company experience when establishing anticipated mortality for each class;
- F. Analysis performed to evaluate the relationship between the underwriting-based criteria and the anticipated mortality established in each class.
- G. Statistical or other quantitative analyses performed in assessing the continued appropriateness of the anticipated mortality assumption for each class and for all classes in aggregate, and a summary of changes made as a result of the analyses;
- H. Anticipated Mortality, without recognition of mortality improvement beyond the date of valuation, for each class and for all classes in aggregate;
- I. For each class, the ratio of Anticipated Mortality to the mortality rates in the Valuation Basic Table corresponding to the set of valuation mortality rates being used for that class;
- J. Any changes made in the approach or parameters applied to the statistical analyses or tests performed compared to those performed at the last annual valuation; and,
- K. Disclosure of the financial impact of any change in the chosen set of valuation mortality rates

Drafting Note: Annual actuarial opinions, certifications and reports for the use of “X” factors have been required since the implementation of the NAIC *Valuation of Life Insurance Model Regulation*. The work and analysis to be performed for Preferred Class Certification is very similar to the requirements for the use of the “X” factors and the appointed actuary may combine the selection and analysis of “X” factors and the selection and analysis of applicable CSO Preferred Class Structure Mortality Table into one actuarial opinion, certification and annual experience report, if the appointed actuary wishes to do so.

6. Other Items of Note

- A. If a class of business is assigned to a different set of mortality rates within the applicable CSO Preferred Class Structure Mortality Table (either a higher or lower level of mortality rates) from that used in the prior valuation, the change is not considered a basis change, and the reserve change must be accounted for in the calculation of gain from operations.
- B. Multiple underwriting classes on a policy form can be mapped into the same set of mortality rates within the applicable CSO Preferred Class Structure Mortality Table, if, in aggregate, the underwriting classes can be shown to have anticipated mortality no greater than the valuation basic table underlying the set of mortality rates selected.
- C. If a company chooses to use the applicable CSO Preferred Class Structure Mortality Table for basic reserves, the same table must be the basis for the calculation of deficiency reserves, if applicable.

Not for Distribution

Actuarial Guideline XLIII

CARVM FOR VARIABLE ANNUITIES

Section I) Background

The purpose of this Actuarial Guideline (Guideline) is to interpret the standards for the valuation of reserves for variable annuity and other contracts involving certain guaranteed benefits similar to those offered with variable annuities. The Guideline codifies the basic interpretation of the Commissioners Annuity Reserve Valuation Method (CARVM) by clarifying the assumptions and methodologies that will comply with the intent of the Standard Valuation Law (SVL). It also applies similar assumptions and methodologies to contracts that contain characteristics similar to those described in the scope, but that are not directly subject to CARVM.

For many years regulators and the industry have struggled with the issue of applying a uniform reserve standard to these contracts and in particular some of the guaranteed benefits referenced above. Current approaches make assumptions about product design, contractholder behavior and economic relationships and conditions. The economic volatility seen over the last few decades, combined with an increase in the complexity of these products, have made attempts to use these approaches for measuring economic-related risk less successful.

The Guideline addresses these issues by including an approach that applies principles of asset adequacy analysis directly to the risks associated with these products and guarantees.

The NAIC is currently using a similar approach to calculate risk-based capital (RBC) for similar contracts (i.e., the C-3 Phase II project). The methodology in the Guideline is based on that approach, and the intent of the Guideline is to, where possible, facilitate a framework whereby companies may determine both reserve and RBC in a consistent calculation.

In developing the Guideline, two regulatory sources were looked to for guidance. First, the SVL requires that CARVM be based on the greatest present value of future guaranteed benefits. Second, the NAIC Model Variable Annuity Regulation (VAR) states that the “reserve liability for variable annuities shall be established pursuant to the requirements of the Standard Valuation Law in accordance with actuarial procedures that recognize the variable nature of the benefits provided and any mortality guarantees.”

The Guideline requires that reserves for contracts falling within its scope be based on a minimum floor determined using a standard scenario (referred to as the Standard Scenario Amount) plus the excess over this minimum floor, if any, of a reserve calculated using a projection of the assets and estimated liabilities supporting these contracts over a broad range of stochastically generated projection scenarios and using prudent estimate assumptions (referred to as the Conditional Tail Expectation Amount). Within each of these scenarios, the greatest of the present values of accumulated losses ignoring Federal Income Tax is determined. The assumed fund performance for these scenarios must meet the mandated calibration standards contained in the Guideline. The reserve calculated using projections is based on a Conditional Tail Expectation measure of the results for each scenario.

Conditional Tail Expectation (CTE) is a statistical risk measure that provides enhanced information about the tail of a distribution above that provided by the traditional use of percentiles. Instead of only identifying a value at a particular percentile and thus ignoring the possibility of extremely large values in the tail, CTE recognizes a portion of the tail by providing the average over all values in the tail beyond the CTE percentile. Thus where the tail of the distribution of losses approximates that of a standard normal distribution, CTE (70) will approximate the 88th percentile; where the tail is “fatter” than that of a standard normal distribution, CTE (70) will exceed the 88th percentile; and where the tail is not as “fat” as a standard normal distribution, CTE (70) will be lower than the 88th percentile. Therefore, for distributions with “fat tails” from low probability, high impact events, such as those covered by the Guideline, the use of CTE will provide a more revealing measure than use of a single percentile requirement.

For certain products (e.g., variable annuities with Guaranteed Minimum Death Benefits only), a company can use an Alternative Methodology in place of the modeling approach outlined above to determine the Conditional Tail Expectation Amount.

The projection methodology used to calculate the Conditional Tail Expectation Amount, as well as the approach used to develop the Alternative Methodology, is based on the following set of principles. These principles should be followed when applying the methodology in the Guideline and analyzing the resulting reserves.¹

Principle 1. The objective of the approach used to determine the Conditional Tail Expectation Amount is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed.

Principle 2. The calculation of the Conditional Tail Expectation Amount is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash flow model to equity return and interest rate scenarios. For each scenario the greatest present value of accumulated surplus deficiency is calculated. The analysis reflects Prudent Estimate (see the definition of Prudent Estimate in Section III) assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions)² to allow the natural offset of risks within a given scenario. The methodology utilizes a projected total statutory balance sheet approach by including all projected income, benefit and expense items related to the business in the model and sets the Conditional Tail Expectation Amount at a degree of confidence using the conditional tail expectation measure applied to the set

¹ Note the following when considering these principles:

- a. The principles should be considered in their entirety.
- b. The Guideline requires companies to meet these principles with respect to only those contracts that fall within the scope of the Guideline and are in force as of the valuation date to which the requirements are applied.

² Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.

of scenario specific greatest present values of accumulated statutory deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Principle 3. The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the actuary's confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually,³ the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the Conditional Tail Expectation Amount at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the Conditional Tail Expectation Amount, the actuary should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Principle 4. While a stochastic cash flow model attempts to include all real world risks relevant to the objective of the stochastic cash flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the Conditional Tail Expectation Amount is based on the results derived from the application of the stochastic cash flow model to scenarios while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting Prudent Estimate assumptions to the extent not addressed by other means.

Principle 5. Neither a cash flow scenario model, nor a method based on factors calibrated to the results of a cash flow scenario model, can completely quantify a company's exposure to risk. A model attempts to represent reality, but will always remain an approximation thereto and hence uncertainty in future experience is an important consideration when determining the Conditional Tail Expectation Amount. Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated Conditional Tail Expectation Amount without also reducing risk on scenarios similar to those used in the actual cash flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit 'foreknowledge' of the components of the required methodology.

The methodology prescribed in the Guideline is applied to a company's entire portfolio of variable annuities (whether or not they contain guaranteed benefits), as well as other affected products that contain guaranteed benefits. Current guaranteed benefits include Guaranteed Minimum Death Benefits, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Withdrawal Benefits, and Guaranteed Payout Annuity Floors. It is also expected that the methodology in the Guideline will be applied to future variations on these designs and to new guarantee designs.

Since statutory reporting requires companies to report reserves prior to reinsurance, the Guideline clarifies standards for adjusting the various components of the reserve so that the reserve may be reported both prior to and net of reinsurance.

The Guideline also requires an allocation of the total reported reserve between the General and Separate Accounts and prescribes a method for doing this allocation.

³ The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Appendix 9 provides the requirements and guidance for setting contractholder behavior and includes alternatives to this framework if the actuary is unable to fully apply this principle.

Actuarial certification of the work done to calculate reserves is required by the Guideline. A qualified actuary (referred to throughout the Guideline as “the actuary”) shall certify that the work has been done in a way that meets all applicable Actuarial Standards of Practice.

For more details on the development of these requirements, including the development of the calibration criteria, see the American Academy of Actuaries recommendation on C-3 Phase II risk-based capital.

This Guideline and its Appendices require the actuary to make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in this Guideline and its Appendices and responsibilities arising from applicable Actuarial Standards of Practice, including ASOP No. 23, *Data Quality*.

The risks reflected in the calculation of reserves under this Guideline arise from actual or potential events or activities which are both:

- a) Directly related to the contracts falling under the scope of this Guideline or their supporting assets; and
- b) Capable of materially affecting the reserve.

Categories and examples of risks reflected in the reserve calculations include but are not necessarily limited to:

- a) Asset Risks
 - (i) Separate Account fund performance;
 - (ii) Credit risks (e.g., default or rating downgrades);
 - (iii) Commercial mortgage loan rollover rates (roll-over of bullet loans);
 - (iv) Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk));
 - (v) Performance of equities, real estate, and Schedule BA assets;
 - (vi) Call risk on callable assets;
 - (vii) Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions); and
 - (viii) Currency risk.
- b) Liability Risks
 - (i) Reinsurer default, impairment or rating downgrade known to have occurred before or on the valuation date;
 - (ii) Mortality/longevity, persistency/lapse, partial withdrawal and premium payment risks;
 - (iii) Utilization risk associated with guaranteed living benefits;
 - (iv) Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted;
 - (v) Annuitization risks; and
 - (vi) Additional premium dump-ins (high interest rate guarantees in low interest rate environments);
- c) Combination Risks
 - (i) Risks modeled in the company’s risk assessment processes that are related to the contracts, as described above;
 - (ii) Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits); and
 - (iii) Risks associated with Revenue Sharing Income.

The risks not necessarily reflected in the calculation of reserves under this Guideline are:

- a) Those not reflected in the determination of Risk-Based Capital; and

- b) Those reflected in the determination of Risk-Based Capital but arising from obligations of the company not directly related to the contracts falling under the scope of this Guideline, or their supporting assets, as described above.

Categories and examples of risks not reflected in the reserve calculations include but are not necessarily limited to:

- a) Asset Risks
Liquidity risks associated with a “run on the bank.”
- b) Liability Risks
(i) Reinsurer default, impairment or rating downgrade occurring after the valuation date;
(ii) Catastrophic events (e.g., epidemics or terrorist events);
(iii) Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience; and
(iv) Significant future reserve increases as an unfavorable scenario is realized.
- c) General Business Risks
(i) Deterioration of reputation;
(ii) Future changes in anticipated experience (reparameterization in the case of stochastic processes) which would be triggered if and when adverse modeled outcomes were to actually occur;
(iii) Poor management performance;
(iv) The expense risks associated with fluctuating amounts of new business;
(v) Risks associated with future economic viability of the company;
(vi) Moral hazards; and
(vii) Fraud and theft.

Section II) Scope

- A) The Guideline applies to contracts, whether directly written or assumed through reinsurance, falling into any of the following categories:
- 1) Variable deferred annuity contracts subject to the Commissioner’s Annuity Reserve Valuation Method (CARVM), whether or not such contracts contain Guaranteed Minimum Death Benefits (GMDBs), or Variable Annuity Guaranteed Living Benefits (VAGLBs);
 - 2) Variable immediate annuity contracts, whether or not such contracts contain GMDBs or VAGLBs;
 - 3) Group annuity contracts that are not subject to CARVM, but contain guarantees similar in nature⁴ to GMDBs, VAGLBs, or any combination thereof; and
 - 4) All other products that contain guarantees similar in nature to GMDBs or VAGLBs, even if the insurer does not offer the mutual funds or variable funds to which these guarantees relate, where there is no other explicit reserve requirement.⁵

⁴ The term “similar in nature,” as used in sections II(A)3) and II(A)4) is intended to capture both current products and benefits as well as product and benefit designs that may emerge in the future. Examples of the currently known designs are listed in footnote #5 below. Any product or benefit design that does not clearly fit the Scope should be evaluated on a case-by-case basis taking into consideration factors that include, but are not limited to, the nature of the guarantees, the definitions of GMDB and VAGLB in sections III(A)1) and III(A)2) and whether the contractual amounts paid in the absence of the guarantee are based on the investment performance of a market-value fund or market-value index (whether or not part of the company’s separate account).

⁵ For example, a group life contract that wraps a GMDB around a mutual fund would generally fall under the scope of the Guideline since there is not an explicit reserve requirement for this type of group life contract. However, for an individual

If such a benefit is offered as part of a contract that has an explicit reserve requirement and that benefit does not currently have an explicit reserve requirement:

- a) The Guideline shall be applied to the benefit on a standalone basis (i.e., for purposes of the reserve calculation, the benefit shall be treated as a separate contract);
 - b) The reserve for the underlying contract is determined according to the explicit reserve requirement; and
 - c) The reserve held for the contract shall be the sum of a) and b).
- B) The Guideline does not apply to contracts falling under the scope of the NAIC Model Modified Guaranteed Annuity Regulation (MGAs); however, it does apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in MGAs (e.g., market value adjustments).
- C) Separate account products that guarantee an index and do not offer GMDBs or VAGLBs are excluded from the scope of the Guideline.

Section III) Definitions

A) Definitions of Benefit Guarantees

- 1) Guaranteed Minimum Death Benefit (GMDB). A GMDB is a guaranteed benefit providing, or resulting in the provision that, an amount payable on the death of a contractholder, annuitant, participant, or insured will be increased and/or will be at least a minimum amount. Only such guarantees having the potential to produce a contractual total amount payable on death that exceeds the account value, or in the case of an annuity providing income payments, an amount payable on death other than continuation of any guaranteed income payments, are included in this definition. GMDBs that are based on a portion of the excess of the account value over the net of premiums paid less partial withdrawals made (e.g., an Earnings Enhanced Death Benefit) are also included in this definition.
- 2) Variable Annuity Guaranteed Living Benefit (VAGLB). A VAGLB is a guaranteed benefit providing, or resulting in the provision that, one or more guaranteed benefit amounts payable or accruing to a living contractholder or living annuitant, under contractually specified conditions (e.g., at the end of a specified waiting period, upon annuitization, or upon withdrawal of premium over a period of time), will increase contractual benefits should the contract value referenced by the guarantee (e.g., account value) fall below a given level or fail to achieve certain performance levels. Only such guarantees having the potential to provide benefits with a present value as of the benefit commencement date that exceeds the contract value referenced by the guarantee are included in this definition. Payout annuities without minimum payout or performance guarantees are neither considered to contain nor to be VAGLBs.
- 3) Guaranteed Minimum Income Benefit (GMIB). A GMIB is a VAGLB design for which the benefit is contingent on annuitization of a variable deferred annuity or similar contract. The benefit is typically expressed as a contractholder option, on one or more option dates, to have a minimum amount applied to provide periodic income using a specified purchase basis.

variable life contract with a GMDB and a benefit similar in nature to a VAGLB, the Guideline would generally apply only to the VAGLB-type benefit, since there is an explicit reserve requirement that applies to the variable life contract and the GMDB.

- 4) Guaranteed Payout Annuity Floor (GPAF). A GPAF is a VAGLB design guaranteeing that one or more of the periodic payments under a variable immediate annuity will not be less than a minimum amount.

B) Definitions of Reserve Methodology Terminology

- 1) Scenario. A scenario consists of a set of asset growth rates and investment returns from which assets and liabilities supporting a set of contracts may be determined for each year of a projection.
- 2) Cash Surrender Value. For purposes of the Guideline, the Cash Surrender Value for a contract is the amount available to the contractholder upon surrender of the contract. Generally, it is equal to the account value less any applicable surrender charges, where the surrender charge reflects the availability of any free partial surrender options. For contracts where all or a portion of the amount available to the contractholder upon surrender is subject to a market value adjustment, however, the Cash Surrender Value shall reflect the market value adjustment consistent with the required treatment of the underlying assets. That is, the Cash Surrender Value shall reflect any market value adjustments where the underlying assets are reported at market value, but shall not reflect any market value adjustments where the underlying assets are reported at book value.
- 3) Scenario Greatest Present Value. For a given scenario, the Scenario Greatest Present Value is the sum of:
 - a) The greatest of the present values, as of the projection start date, of the projected Accumulated Deficiencies for the scenario; and
 - b) The Starting Asset Amount, as defined below.
- 4) Conditional Tail Expectation Amount. The Conditional Tail Expectation Amount is equal to the numerical average of the 30 percent largest values of the Scenario Greatest Present Values.
- 5) Working Reserve. The Working Reserve is the assumed reserve used in the projections of Accumulated Deficiencies supporting the calculation of the Scenario Greatest Present Values. At any point in the projections, including at the start of the projection, the Working Reserve shall equal the projected Cash Surrender Value.

For a variable payout annuity without a Cash Surrender Value, the Working Reserve shall equal the present value, at the valuation interest rate and the valuation mortality table specified for such a product by the Standard Valuation Law of future income payments projected using a return based on the valuation interest rate less appropriate asset based charges. For annuitizations that occur during the projection, the valuation interest rate as of the current valuation date may be used in determining the Working Reserve. Alternatively, if an integrated model of equity returns and interest rates is used, a future estimate of valuation interest rates may be incorporated into the Working Reserve.

For contracts not covered above, the actuary shall determine the Working Reserve in a manner that is consistent with the above requirements.

- 6) Accumulated Deficiency. Accumulated Deficiency is an amount measured as of the end of a projection year and equals the projected Working Reserve less the amount of

projected assets, both as of the end of the projection year. Accumulated Deficiencies may be positive or negative.⁶

- 7) Starting Asset Amount. The Starting Asset Amount equals the value of the assets at the start of the projection, as defined in section A1.4)A) of Appendix 1.
- 8) Prudent Estimate. The deterministic assumptions to be used for projections are to be the actuary's Prudent Estimate. This means that they are to be set at the conservative end of the actuary's confidence interval as to the true underlying probabilities for the parameter(s) in question, based on the availability of relevant experience and its degree of credibility.

A Prudent Estimate assumption is developed by applying a margin for uncertainty to the "Anticipated Experience" assumption. The margin for uncertainty shall provide for estimation error and margins for adverse deviation. The resulting Prudent Estimate assumption shall be reasonably conservative over the span of economic cycles and over a plausible range of expected experience, in recognition of the Principles described in Section I. "Anticipated Experience" would typically be the actuary's reasonable estimate of future experience for a risk factor given all available, relevant information pertaining to the contingencies being valued. Recognizing that assumptions are simply assertions of future unknown experience, the margin should be directly related to uncertainty in the underlying risk factor. The greater the uncertainty, the larger the margin. Each margin should serve to increase the Aggregate Reserve that would otherwise be held in its absence (i.e., using only the Anticipated Experience assumption).

For example, assumptions for circumstances that have never been observed require more margins for error than those for which abundant and relevant experience data are available.

This means that valuation assumptions not stochastically modeled are to be consistent with the stated Principles in Section I, be based on any relevant and credible experience that is available, and should be set to produce, in concert with other Prudent Estimate assumptions, a Conditional Tail Expectation Amount that is consistent with the stated CTE level.

The actuary shall follow the principles discussed in Appendices 9 and 10 in determining Prudent Estimate assumptions.

- 9) Gross Wealth Ratio. The Gross Wealth Ratio is the cumulative return for the indicated time period and percentile (e.g., 1.0 indicates that the index is at its original level).
- 10) Clearly Defined Hedging Strategy. The designation of Clearly Defined Hedging Strategy applies to strategies undertaken by a company to manage risks through the future purchase or sale of hedging instruments and the opening and closing of hedging positions. In order to qualify as a Clearly Defined Hedging Strategy, the strategy must meet the principles outlined in the Background section of the Guideline (particularly Principle 5) and shall, at a minimum, identify:
 - a) The specific risks being hedged (e.g., delta, rho, vega, etc.),
 - b) The hedge objectives,

⁶ Note that a positive Accumulated Deficiency means that there is a cumulative loss and a negative Accumulated Deficiency means that there is a cumulative gain.

- c) The risks not being hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.),
- d) The financial instruments that will be used to hedge the risks,
- e) The hedge trading rules including the permitted tolerances from hedging objectives,
- f) The metric(s) for measuring hedging effectiveness,
- g) The criteria that will be used to measure effectiveness,
- h) The frequency of measuring hedging effectiveness,
- i) The conditions under which hedging will not take place, and
- j) The person or persons responsible for implementing the hedging strategy.

The hedge strategy may be dynamic, static, or a combination thereof.

It is important to note that strategies involving the offsetting of the risks associated with variable annuity guarantees with other products outside of the scope of the Guideline (e.g., equity-indexed annuities) do not currently qualify as a Clearly Defined Hedging Strategy under the Guideline.

- 11) Revenue Sharing. Revenue Sharing, for purposes of the Guideline, means any arrangement or understanding by which an entity responsible for providing investment or other types of services makes payments to the company (or to one of its affiliates). Such payments are typically in exchange for administrative services provided by the company (or its affiliate), such as marketing, distribution and recordkeeping. Only payments that are attributable to charges or fees taken from the underlying variable funds or mutual funds supporting the contracts that fall under the scope of the Guideline shall be included in the definition of Revenue Sharing.
- 12) Domiciliary Commissioner. For purposes of the Guideline, this term refers to the chief insurance regulatory official of the state of domicile of the company.
- 13) Aggregate Reserve. The minimum reserve requirement as of the valuation date for the contracts falling within the scope of the Guideline.
- 14) 1994 Variable Annuity MGDB Mortality Table. This mortality table is shown in Appendix 11.

Section IV) Definition of General Reserve Methodology

- A) General Description. The Aggregate Reserve for contracts falling within the scope of the Guideline shall equal the Conditional Tail Expectation Amount but not less than the Standard Scenario Amount, where the Aggregate Reserve is calculated as the Standard Scenario Amount plus the excess, if any, of the Conditional Tail Expectation Amount over the Standard Scenario Amount.
- B) Impact of Reinsurance Ceded. Where reinsurance is ceded for all or a portion of the contracts, both components in the above general description (and thus the Aggregate Reserve) shall be determined net of any reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance.

An Aggregate Reserve before reinsurance shall also be calculated if needed for regulatory reporting or other purposes, using methods described in Appendix 2.

- C) The Standard Scenario Amount. The Standard Scenario Amount is the aggregate of the reserves determined by applying the Standard Scenario method to each of the contracts falling within the scope of the Guideline. The Standard Scenario method is outlined in Appendix 3.
- D) The Conditional Tail Expectation Amount. The Conditional Tail Expectation Amount shall be determined based on a projection of the contracts falling within the scope of the Guideline, and the assets supporting these contracts, over a broad range of stochastically generated projection scenarios and using Prudent Estimate assumptions.

The stochastically generated projection scenarios shall meet the Scenario Calibration Criteria described in Appendix 5.

The Conditional Tail Expectation Amount may be determined in aggregate for all contracts falling within the scope of the Guideline (i.e., a single grouping). At the option of the company, it may be determined by applying the methodology outlined below to sub-groupings of contracts, in which case, the Conditional Tail Expectation Amount shall equal the sum of the amounts computed for each such sub-grouping.

The Conditional Tail Expectation Amount shall be determined using the following steps:

- 1) For each scenario, projected aggregate Accumulated Deficiencies are determined at the start of the projection (i.e., “time 0”) and at the end of each projection year as the sum of the Accumulated Deficiencies for each contract grouping.
- 2) The Scenario Greatest Present Value is determined for each scenario based on the sum of the aggregate Accumulated Deficiencies⁷ and aggregate Starting Asset Amounts for the contracts for which the Aggregate Reserve is being computed.
- 3) The Scenario Greatest Present Values for all scenarios are then ranked from smallest to largest and the Conditional Tail Expectation Amount is the average of the largest 30 percent of these ranked values.

The projections shall be performed in accordance with Appendix 1. The actuary shall document the assumptions and procedures used for the projections and summarize the results obtained as described in Appendix 2 and Appendix 8.

- E) Alternative Methodology. For variable deferred annuity contracts that contain either no guaranteed benefits or only GMDBs (i.e., no VAGLBs), the Conditional Tail Expectation Amount may be determined using the Alternative Methodology described in Appendix 4 rather than using the approach described in subsection D) above. However, in the event the approach described in subsection D) has been used in prior valuations the Alternative Methodology may not be used without approval from the Domiciliary Commissioner.

The Conditional Tail Expectation Amount for the group of contracts to which the Alternative Methodology is applied shall not be less than the aggregate Cash Surrender Value of those contracts.

The actuary shall document the assumptions and procedures used for the Alternative Methodology and summarize the results obtained as described in Appendix 2 and Appendix 8.

⁷ The Scenario Greatest Present Value is therefore based on the greatest projected Accumulated Deficiency, in aggregate, for all contracts for which the Aggregate Reserve is computed hereunder, rather than based on the sum of the greatest projected Accumulated Deficiency for each grouping of contracts.

- F) Allocation of Results to Contracts. The Aggregate Reserve shall be allocated to the contracts falling within the scope of the Guideline using the method outlined in Appendix 6.
- G) Reserve as of January 1, 2009. The reserve as of January 1, 2009 shall be the sum of the reserves from the asset adequacy analysis requirements in Actuarial Guideline XXXIV and Actuarial Guideline XXXIX.

Section V) Effective Date

The Guideline affects all contracts issued on or after January 1, 1981, effective December 31, 2009. Where the application of the Guideline produces higher reserves than the company had otherwise established by their previously used interpretation, such company may request a grade-in period, not to exceed three (3) years, from the Domiciliary Commissioner upon satisfactory demonstration of the previous interpretation and that such delay of implementation will not cause a hazardous financial condition or potential harm to its policyholders. The grading shall be done only on the reserves on the contracts in-force as of December 31, 2009. The reserves under the old basis and new basis shall be compared each year - 2/3 of the difference shall be subtracted from the reserve under the new basis in 2009 and 1/3 of the difference shall be subtracted from the reserve under the new basis in 2010.

Not for Distribution

APPENDIX 1 - Determination of Conditional Tail Expectation Amount Based on Projections

A1.1) Projection of Accumulated Deficiencies

- A) General Description of Projection. The projection of Accumulated Deficiencies shall be made ignoring Federal Income Tax and reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including the guarantees provided under the contracts. Insurance company expenses (including overhead and investment expense), fund expenses, contractual fees and charges, revenue sharing income received by the company (net of applicable expenses) and cash flows associated with any reinsurance or hedging instruments are to be reflected on a basis consistent with the requirements herein. Cash flows from any fixed account options shall also be included. Any market value adjustment assessed on projected withdrawals or surrenders shall also be included (whether or not the Cash Surrender Value reflects market value adjustments). Throughout the projection, where estimates are used, such estimates shall be on a Prudent Estimate basis.

Federal Income Tax shall not be included in the projection of Accumulated Deficiencies.

- B) Grouping of Variable Funds and Subaccounts. The portion of the Starting Asset Amount held in the Separate Account represented by the variable funds and the corresponding account values may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of the funds. In assigning each variable fund and the variable subaccounts to a grouping for projection purposes, the fundamental characteristics of the fund shall be reflected and the parameters shall have the appropriate relationship to the required calibration points of the S&P 500. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

An appropriate proxy for each variable subaccount shall be designed in order to develop the investment return paths. The development of the scenarios for the proxy funds is a fundamental step in the modeling and can have a significant impact on results. As such, the actuary must map each variable account to an appropriately crafted proxy fund normally expressed as a linear combination of recognized market indices (or sub-indices).

- C) Grouping of Contracts. Projections may be performed for each contract in force on the date of valuation or by grouping contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Grouping shall be the responsibility of the actuary but may not be done in a manner that intentionally understates the resulting reserve.
- D) Modeling of Hedges. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of the Guideline shall be included in the projections. If the company is following a Clearly Defined Hedging Strategy and the hedging strategy meets the requirements of Appendix 7, the projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future through the execution of that strategy.

To the degree either the currently held hedge positions or the hedge positions expected to be held in the future introduce basis, gap, price, or assumption risk, a suitable reduction for effectiveness of hedges shall be made. The actuary is responsible for verifying compliance with a Clearly Defined Hedging Strategy and the requirements in Appendix 7 for all hedge instruments included in the projections.

While hedging strategies may change over time, any change in hedging strategy shall be documented and include an effective date of the change in strategy.

The use of products not falling under the scope of the Guideline (e.g., equity-indexed annuities) as a hedge shall not be recognized in the determination of Accumulated Deficiencies.

These requirements do not supersede any statutes, laws, or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

Upon request of the company's domiciliary commissioner and for information purposes to show the effect of including future hedge positions in the projections, the company shall show the results of performing an additional set of projections reflecting only the hedges currently held by the company in support of the contracts falling under the scope of the Guideline. Because this additional set of projections excludes some or all of the derivative instruments, the investment strategy used may not be the same as that used in the determination of the Conditional Tail Expectation Amount.

E) Revenue Sharing.

- 1) Projections of Accumulated Deficiencies may include income from projected future Revenue Sharing, as defined in Section III) net of applicable projected expenses ("Net Revenue Sharing Income") if the following requirements are met:
 - a) The Net Revenue Sharing Income is received⁸ by the company,⁹
 - b) Signed contractual agreement or agreements are in place as of the valuation date and support the current payment of the Net Revenue Sharing Income; and
 - c) The Net Revenue Sharing Income is not already accounted for directly or indirectly as a company asset.

- 2) The amount of Net Revenue Sharing Income to be used shall reflect the actuary's assessment of factors that include but are not limited to the following (not all of these factors will necessarily be present in all situations):
 - a) The terms and limitations of the agreement(s), including anticipated revenue, associated expenses and any contingent payments incurred or made by either the company or the entity providing the Net Revenue Sharing as part of the agreement(s);
 - b) The relationship between the company and the entity providing the Net Revenue Sharing Income that might affect the likelihood of payment and the level of expenses;
 - c) The benefits and risks to both the company and the entity paying the Net Revenue Sharing Income of continuing the arrangement.

⁸ For purposes of this section, Net Revenue Sharing Income is considered to be received by the company if it is paid directly to the company through a contractual agreement with either the entity providing the Net Revenue Sharing Income or an affiliated company that receives the Net Revenue Sharing Income. Net Revenue Sharing Income would also be considered to be received, if it is paid to a subsidiary that is owned by the company and if 100% of the statutory income from that subsidiary is reported as statutory income of the company. In this case the actuary needs to assess the likelihood that future Net Revenue Sharing Income is reduced due to the reported statutory income of the subsidiary being less than future Net Revenue Sharing Income received.

⁹ As in other sections of the Guideline, the term "the company" is used exclusively as a reference to the insurance company writing the business falling under the scope of the Guideline. The term "entity providing the Net Revenue Sharing Income" is self-explanatory and is used consistently in this subsection.

- d) The likelihood that the company will collect the Net Revenue Sharing Income during the term(s) of the agreement(s) and the likelihood of continuing to receive future revenue after the agreement(s) has ended;
 - e) The ability of the company to replace the services provided to it by the entity providing the Net Revenue Sharing Income or to provide the services itself, along with the likelihood that the replaced or provided services will cost more to provide; and
 - f) The ability of the entity providing the Net Revenue Sharing Income to replace the services provided to it by the company or to provide the services itself, along with the likelihood that the replaced or provided services will cost more to provide.
- 3) The amount of projected Net Revenue Sharing Income shall also reflect a margin (which decreases the assumed Net Revenue Sharing Income) directly related to the uncertainty of the revenue. The greater the uncertainty, the larger the margin. Such uncertainty is driven by many factors including the potential for changes in the securities laws and regulations, mutual fund board responsibilities and actions, and industry trends. Since it is prudent to assume that uncertainty increases over time, a larger margin shall be applied as time that has elapsed in the projection increases.
 - 4) All expenses required or assumed to be incurred by the company in conjunction with the arrangement providing the Net Revenue Sharing Income, as well as any expenses assumed to be incurred by the company in conjunction with the assumed replacement of the services provided to it (as discussed in subsection 2)e) above) shall be included in the projections as a company expense under the requirements of section A1.1)A). In addition, expenses incurred by either the entity providing the Net Revenue Sharing Income or an affiliate of the company shall be included in the applicable expenses discussed in section A1.1)A) and A1.1)E)1) that reduce the Net Revenue Sharing Income.
 - 5) The actuary is responsible for reviewing the revenue sharing agreements, verifying compliance with these requirements, and documenting the rationale for any source of Net Revenue Sharing Income used in the projections.
 - 6) The amount of Net Revenue Sharing Income assumed in a given scenario shall not exceed the sum of a) and b), where:
 - a) Is the contractually guaranteed Net Revenue Sharing Income projected under the scenario, and
 - b) Is the actuary's estimate of non-contractually guaranteed Net Revenue Sharing Income before reflecting any margins for uncertainty multiplied by the following factors:
 - (i) 1.0 in the first projection year;
 - (ii) 0.9 in the second projection year;
 - (iii) 0.8 in the third projection year;
 - (iv) 0.7 in the fourth projection year;
 - (v) 0.6 in the fifth projection year;
 - (vi) 0.5 in the sixth and all subsequent projection years. The resulting amount of non-contractually guaranteed Net Revenue Sharing Income after application of this factor shall not exceed 0.25% per year on separate account assets in the sixth and all subsequent projection years.

- F) Length of Projections. Projections of Accumulated Deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods.
- G) AVR/IMR. The AVR and the IMR shall be handled consistently with the treatment in the company's cash flow testing.

A1.2) Determination of Scenario Greatest Present Values

- A) Scenario Greatest Present Values. For a given scenario, the Scenario Greatest Present Value is the sum of:
- 1) The greatest present value, as of the projection start date, of the projected Accumulated Deficiencies defined in Section III)B)6); and
 - 2) The Starting Asset Amount.
- B) Discount Rates. In determining the Scenario Greatest Present Values, Accumulated Deficiencies shall be discounted using the same interest rates at which positive cash flows are invested, as determined in section A1.4)D). Such interest rates shall be reduced to reflect expected credit losses. Note that the interest rates used do not include a reduction for Federal Income Taxes.

A1.3) Projection Scenarios

- A) Minimum Required Scenarios. The number of scenarios for which projected greatest present values of Accumulated Deficiencies shall be computed shall be the responsibility of the actuary and shall be considered to be sufficient if any resulting understatement in total reserves, as compared with that resulting from running additional scenarios, is not material.
- B) Scenario Calibration Criteria. Returns for the groupings of variable funds shall be determined on a stochastic basis such that the resulting distribution of the Gross Wealth Ratios of the scenarios meets the Scenario Calibration Criteria specified in Appendix 5.

A1.4) Projection Assets

- A) Starting Asset Amount. For the projections of Accumulated Deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:
- 1) All of the Separate Account assets supporting the contracts;
 - 2) An amount of assets held in the General Account equal to the approximate value of statutory reserves as of the start of the projections less the amount in 1), above.

In many instances the initial General Account assets may be negative, resulting in a projected interest expense. General Account assets chosen for use as described above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

Any hedge assets meeting the requirements described in section A1.1)D) shall be reflected in the projections and included with other General Account assets under item 2) above. To the extent the sum of the value of such hedge assets and the value of assets in item 1) above is greater than

the approximate value of statutory reserves as of the start of the projections, then item 2) above may include enough negative General Account assets or cash such that the sum of items 1) and 2) above equals the approximate value of statutory reserves as of the start of the projections.¹⁰

The actuary shall document which assets were used as of the start of the projection, the approach used to determine which assets were chosen and shall verify that the value of the assets equals the approximate value of statutory reserves at the start of the projection.

- B) Valuation of Projected Assets. For purposes of determining the projected Accumulated Deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics.
- C) Separate Account Assets. For purposes of determining the Starting Asset Amounts in subsection A) and the valuation of projected assets in subsection B), assets held in a Separate Account shall be summarized into asset categories determined by the actuary as discussed in section A1.1)B).
- D) General Account Assets. General Account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested at interest rates, which, at the option of the actuary, are one of the following:
- 1) The forward interest rates implied by the swap curve¹¹ in effect as of the valuation date,
 - 2) The 200 interest rate scenarios available as prescribed for Phase I, C-3 Risk Based Capital calculation, coupled with the Separate Account return scenarios by mating them up with the first 200 such scenarios and repeating this process until all Separate Account return scenarios have been mated with a Phase I scenario, or
 - 3) Interest rates developed for this purpose from a stochastic model that integrates the development of interest rates and the Separate Account returns.

When the option described in 1) above (the forward interest rates implied by the swap curve) is used, an amount shall be subtracted from the interest rates to reflect the current market expectations about future interest rates using the process described in section A1.5)A).

The actuary may switch from 1) to 2), from 1) to 3) or from 2) to 3) from one valuation date to the next, but may not switch in the other direction without approval from the Domiciliary Commissioner.

A1.5) Projection of Annuitization Benefits (including GMIBs)

- A) Assumed Annuitization Purchase Rates at Election. For purposes of projecting annuitization benefits (including annuitizations stemming from the election of a GMIB), the projected annuitization purchase rates shall be determined assuming that market interest rates available at the time of election are the interest rates used to project General Account Assets, as determined in

¹⁰ Further elaboration on potential practices with regard to this issue may be included in a practice note.

¹¹ The swap curve is based on the Federal Reserve H.15 interest swap rates. The rates are for a Fixed Rate Payer in return for receiving three month LIBOR. One place where these rates can be found is <http://www.federalreserve.gov/releases/h15/default.htm>.

A1.4)D). However, where the interest rates used to project General Account Assets are based upon the forward interest rates implied by the swap curve in effect as of the valuation date (i.e., the option described in section A1.4)D)1) is used, herein referred to as a point estimate), the margin between the cost to purchase an annuity using the guaranteed purchase basis and the cost using the interest rates prevailing at the time of annuitization shall be adjusted as discussed below.

If a point estimate is being used, it is important that the margin assumed reflects the current market expectations about future interest rates at the time of annuitization, as described more fully below, and a downward adjustment to the interest rate assumed in the purchase rate basis. The latter adjustment is necessary since a greater proportion of contractholders will select an annuitization benefit when it is worth more than the cash surrender value than when it is not. As a practical matter, this effect can be approximated by using an interest rate assumption in the purchase rate basis that is 0.30 percent below that implied by the forward swap curve, as described below.

To calculate market expectations of future interest rates, the par or current coupon swap curve is used (documented daily in Federal Reserve H.15 with some interpolation needed). Deriving the expected rate curve from this swap curve at a future date involves the following steps:

- 1) Calculate the implied zero-coupon rates. This is a well documented “bootstrap” process. For this process we use the equation $100 = C^n * (v + v^2 + \dots + v^n) + 100v^n$ where the “v” terms are used to stand for the discount factors applicable to cash flows 1,2,...n years hence and C^n is the n-year swap rate. Each of these discount factors are based on the forward curve and therefore are based on different rates, however (i.e. “v²” does not equal v times v). Given the one year swap rate, one can solve for v. Given v and the two year swap rate one can then back into v², and so on.
- 2) Convert the zero coupon rates to one year forward rates by calculating the discount factor needed to get from v^{t-1} to v^t.
- 3) Develop the expected rate curve.

This recognizes that, for example, the five-year forward one-year rate is not the rate the market expects on one year instruments five years from now. The reason is that as the bond gets shorter the “risk premium” in the rate diminishes. This is sometimes characterized as “rolling down” the yield curve. Table A shows the historic average risk premium at various durations. From this table, one can see that to get the rate the market expects a 1 year swap to have five years from now; one must subtract the risk premium associated with six year rates (.95%) and add back that associated with 1 year rates (.50%). This results in a net reduction of .45%.

Table A: Risk Premium by Duration

Duration	Risk Premium	Duration	Risk Premium
1	0.500%	6	0.950%
2	0.750%	7	1.000%
3	0.750%	8	1.100%
4	0.850%	9+	1.150%
5	0.900%		

The Exhibit below combines the three steps. Columns A through D convert the swap curve to the implied forward rate for each future payment date. Columns E through H remove the current risk premium, add the risk premium t years in the future (the Exhibit shows the rate curve five years in the future), and uses that to get the discount factors to apply to the 1 year, 2 year,...5 year cash flows 5 years from now.

Exhibit: Derivation of discount rates expected in the future

A	B	C	D	E	F	G	H
Projection Years	Swap Curve Rate	PV of Zero Coupon	Forward 1 Year Rate	Risk Premium	Risk Premium 5 Years Out	Expected Forward Rate In 5 Years	PV of Zero Coupon In 5 Years
1	2.57%	0.97494	2.5700%	0.50000%			
2	3.07%	0.94118	3.5879%	0.75000%			
3	3.44%	0.90302	4.2251%	0.75000%			
4	3.74%	0.86231	4.7208%	0.85000%			
5	3.97%	0.82124	5.0010%	0.90000%			
6	4.17%	0.77972	5.3249%	0.95000%	0.50000%	4.8749%	0.95352
7	4.34%	0.73868	5.5557%	1.00000%	0.75000%	5.3057%	0.90547
8	4.48%	0.69894	5.6860%	1.10000%	0.75000%	5.3360%	0.85961
9	4.60%	0.66050	5.8209%	1.15000%	0.85000%	5.5209%	0.81463
10	4.71%	0.62303	6.0131%	1.15000%	0.90000%	5.7631%	0.77024
Cell formulas for Projection Year 10:		=(1-B13*SUM(\$C\$4:C12))/(1+B13)	=C12/C13 -1		=E8	=D13-E13+F13	=H12/(1+G13)

Where interest rates are projected stochastically using an integrated model, although one would “expect” the interest rate n years hence to be that implied for an appropriate duration asset by the forward swap curve as described above, there is a steadily widening confidence interval about that point estimate with increasing time until the annuitization date. The “expected margin” in the

purchase rate is less than that produced by the point estimate based on the expected rate, since a greater proportion of contractholders will have an annuitization benefit whose worth is in excess of cash surrender value when margins are low than when margins are high. As a practical matter, this effect can be approximated by using a purchase rate margin based on an earnings rate .30 percent below that implied by the forward swap curve. If a stochastic model of interest rates is used instead of a point estimate then no such adjustment is needed.

B) Projected Election of Guaranteed Minimum Income Benefit and other Annuitization Options. For contracts projected to elect annuitization options (including annuitizations stemming from the election of a GMIB), the projections may assume one of the following at the actuary's option:

- 1) The contract is treated as if surrendered at an amount equal to the statutory reserve that would be required at such time for the payout annuity benefits, or
- 2) The contract is assumed to stay inforce, the projected periodic payments are paid, and the Working Reserve is equal to one of the following:
 - a) The statutory reserve required for the payout annuity, if it is a fixed payout annuity, or
 - b) If it is a variable payout annuity, the Working Reserve for a variable payout annuity as defined in Section III)B)5).

If the projected payout annuity is a variable payout annuity containing a floor guarantee (such as a GPAF) under a specified contractual option, only option 2) above shall be used.

Where mortality improvement is used to project future annuitization purchase rates, as discussed in A) above, mortality improvement shall also be reflected on a consistent basis in either the determination of the reserve in 1) above or the projection of the periodic payments in 2) above.

A1.6) Relationship to Risk Based Capital Requirements

- A) The Guideline anticipates that the projections described herein may be used for the determination of Risk Based Capital (the "RBC requirements") for some or all of the contracts falling within the scope of the Guideline. There are several differences between the requirements of the Guideline and the RBC requirements, and among them are two major differences. First, the Conditional Tail Expectation level is different (CTE (70) for the Guideline and CTE (90) for the RBC requirements). Second, the projections described in the Guideline are performed on a basis that ignores Federal Income Tax. That is, under the Guideline, the Accumulated Deficiencies do not include projected Federal Income Tax and the interest rates used to discount the Scenario Greatest Present Value (i.e., the interest rates determined in section A1.4)D)) contain no reduction for Federal Income Tax. Under the RBC requirements, the projections do include projected Federal Income Tax and the discount interest rates used in the RBC requirement do contain a reduction for Federal Income Tax.
- B) To further aid the understanding of the Guideline and any instructions relating to the RBC requirement, it is important to note the equivalence in meaning between the following terms, subject to the differences noted above:
 - 1) The amount that is added to the Starting Asset Amount in Section III)B)6) of the Guideline is similar to the Additional Asset Requirement referenced in the RBC requirement.

- 2) The Conditional Tail Expectation Amount referenced in the Guideline is similar to the Total Asset Requirement referenced in the RBC requirement.

A1.7) Compliance with Actuarial Standards of Practice (ASOPs)

When determining the Conditional Tail Expectation Amount using projections, the analysis shall conform to the Actuarial Standards of Practice as promulgated from time to time by the Actuarial Standards Board.

A1.8) Compliance with Principles

When determining the Conditional Tail Expectation Amount using projections, any interpretation and application of the requirements of the Guideline shall follow the principles discussed in the Section I) Background.

Not for Distribution

APPENDIX 2 - Reinsurance and Statutory Reporting Issues**A.2.1) Treatment of Reinsurance Ceded in the Aggregate Reserve**

- A) Aggregate Reserve Net of and Prior to Reinsurance Ceded. As noted in Section IV)B), the Aggregate Reserve is determined net of reinsurance ceded. Therefore, it is necessary to determine the components needed to determine the Aggregate Reserve (i.e., the Standard Scenario Amount, and either the Conditional Tail Expectation Amount determined using projections or the Conditional Tail Expectation Amount determined using the Alternative Methodology) on a net of reinsurance basis. In addition, as noted in Section IV)B), it may be necessary to determine the Aggregate Reserve determined on a “direct” basis, or prior to reflection of reinsurance ceded. Where this is needed, each of these components shall be determined prior to reinsurance. Sections B) through D) below discuss methods necessary to determine these components on both a “net of reinsurance” and a “prior to reinsurance” basis. Note that due allowance for reasonable approximations may be used where appropriate.
- B) Conditional Tail Expectation Amount Determined using Projections. In order to determine the Aggregate Reserve net of reinsurance ceded, Accumulated Deficiencies, Scenario Greatest Present Values, and the resulting Conditional Tail Expectation Amount shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within the projections. This involves including, where appropriate, all anticipated reinsurance premiums or other costs and all reinsurance recoveries, where both premiums and recoveries are determined by recognizing any limitations in the reinsurance treaties, such as caps on recoveries or floors on premiums.
- In order to determine the Conditional Tail Expectation Amount prior to reinsurance ceded, Accumulated Deficiencies, Scenario Greatest Present Values, and the resulting Conditional Tail Expectation Amount shall be determined ignoring the effects of reinsurance within the projections. One acceptable approach involves a projection based on the same Starting Asset Amount as for the Aggregate Reserve net of reinsurance and by ignoring, where appropriate, all anticipated reinsurance premiums or other costs and all reinsurance recoveries in the projections.
- C) Conditional Tail Expectation Amount Determined using the Alternative Methodology. If a company chooses to use the Alternative Methodology, as allowed in Section IV)E), it is important to note that the methodology produces reserves on a prior to reinsurance ceded basis. Therefore, where reinsurance is ceded, the Alternative Methodology must be modified to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties in the determination of the Aggregate Reserve net of reinsurance. In addition, the Alternative Methodology, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of the Guideline to determine the Aggregate Reserve prior to reinsurance.
- D) Standard Scenario Amount. Where reinsurance is ceded, the Standard Scenario Amount shall be calculated as described in Appendix 3 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. If it is necessary, the Standard Scenario Amount shall be calculated prior to reinsurance ceded using the methods described in Appendix 3, but ignoring the effects of the reinsurance ceded.

A.2.2) Aggregate Reserve to be held in the General Account

The amount of the reserve held in the General Account shall not be less than the excess of the Aggregate Reserve over the sum of the Basic Reserve, as defined in section A3.2), attributable to the variable portion of all such contracts.

A.2.3) Actuarial Certification and Memorandum

- A) Actuarial Certification. Actuarial Certification of the work done to determine the Aggregate Reserve shall be required. The actuary shall certify that the work performed has been done in a way that substantially complies with all applicable Actuarial Standards of Practice. The scope of this certification does not include an opinion on the adequacy of the Aggregate Reserve,¹² the company's surplus or the company's future financial condition. The actuary shall also note any material change in the model or assumptions from that used previously and the estimated impact of such changes.

Appendix 8 contains more information on the contents of the required Actuarial Certification.

- B) Required Memorandum. An actuarial memorandum shall be constructed documenting the methodology and assumptions upon which the Aggregate Reserve is determined. The memorandum shall also include sensitivity tests that the actuary feels appropriate, given the composition of the company's block of business (i.e., identifying the key assumptions that, if changed, produce the largest changes in the Aggregate Reserve). This memorandum shall have the same confidential status as the actuarial memorandum supporting the actuarial opinion¹³ and shall be available to regulators upon request.

Appendix 8 contains more information on the contents of the required memorandum.

- C) Conditional Tail Expectation Amount Determined using the Alternative Methodology. Where the Alternative Methodology is used, there is no need to discuss the underlying assumptions and model in the required memorandum. Certification that expense, revenue, fund mapping, and product parameters have been properly reflected, however, shall be required.

Appendix 8 contains more information on the contents of the required Actuarial Certification and memorandum.

- D) Material Changes. If there is a material change in results due to a change in assumptions from the previous year, the memorandum shall include a discussion of such change in assumptions and an estimate of the impact it has on the results.

¹² The adequacy of total company reserves, which includes the Aggregate Reserve, is addressed in the company's Actuarial Opinion as required by the NAIC Model Actuarial Opinion and Memorandum Regulation.

¹³ This is consistent with Section 3D(8) of the Standard Valuation Law, which states: "Except as provided in Paragraphs (12), (13) and (14), documents, materials or other information in the possession or control of the Department of Insurance that are a memorandum in support of the opinion, and any other material provided by the company to the commissioner in connection with the memorandum, shall be confidential by law and privileged, shall not be subject to [insert open records, freedom of information, sunshine or other appropriate phrase], shall not be subject to subpoena, and shall not be subject to discovery or admissible in evidence in any private civil action. However, the commissioner is authorized to use the documents, materials or other information in the furtherance of any regulatory or legal action brought as a part of the commissioner's official duties."

APPENDIX 3 - Standard Scenario Requirements

A3.1) Overview

- A) Application to Determine Reserves. A Standard Scenario Reserve shall be determined for each of the contracts falling under the scope of the Guideline by applying section A3.3). This includes those contracts to which the Alternative Methodology is applied.

The Standard Scenario Reserve for a contract with guaranteed living benefits or guaranteed death benefits is based on a projection of the account value based on specified returns for supporting assets equal to the account value. An initial drop is applied to the supporting assets and account value on the valuation date. Subsequently, account values are projected at specified rates earned by the supporting assets less contract and fund charges. The assumptions for the projection of account values and margins are prescribed in section A3.3)C). For any contract with guarantees the Standard Scenario Reserve includes the greatest present value of the benefit payments in excess of account values applied over the present value of revenue produced by the margins.

B) The Standard Scenario Amount

- 1) The Standard Scenario Amount is defined in Section IV)C) of this Guideline as the aggregate of the reserves determined by applying the Standard Scenario Method to each of the contracts falling under the scope of the Guideline. Except as provided in subsection A3.3)B)1), the Standard Scenario Amount equals the sum over all contracts of the Standard Scenario Reserve determined for each contract as of the statement date as described in A3.1)B)2).
- 2) The Standard Scenario Method requires the Standard Scenario Amount to not be less than the sum over all contracts of the Standard Scenario Reserve determined for the contract as of the statement date as described in section A3.3), where the Discount Rate is equal to *DR*, which is defined as the valuation interest rate specified by the Standard Valuation Law for annuities valued on an issue year basis, using Plan Type A and a Guarantee Duration greater than 10 years but not more than 20 years. The presence of guarantees of interest on future premiums and/or cash settlement options is to be determined using the terms of the contracts.

- C) Illustrative Application of the Standard Scenario to a Projection or Model Office. If the Conditional Tail Expectation Amount is determined based on a projection of an inforce prior to the statement date and/or by the use of a model office, which is a grouping of contracts into representative cells, then additional determinations of A3.1)B)2) shall be performed on the prior inforce and/or model office. The calculations are for illustrative purposes to assist in validating the reasonableness of the projection and/or the model office.

The following table identifies the illustrative additional determinations required by this section using the Discount Rate, *DR*, as defined in A3.1)B)2). The additional determinations required are based on how the Conditional Tail Expectation projection or Alternative Methodology is applied. For completeness, the table also includes the determinations required by section A3.1)B)2).

- 1) Run A in the table is required for all companies by section A3.1)B)2). No additional determinations are required if a company's stochastic or alternative methodology result is calculated on individual contracts as of the statement date.
- 2) A company that uses a model office as of the statement date to determine its stochastic or alternative methodology result must provide an additional determination for the model office based on the Discount Rate *DR*, run B.

- 3) A company that uses a contract by contract listing of a prior inforce to determine its stochastic or alternative methodology with result PS and then projects requirements to the statement date with result S must provide an additional determination for the prior inforce based on the Discount Rate *DR*, run C.
- 4) A company that uses a model office of a prior inforce to determine its stochastic or alternative methodology requirements with result PM and then projects requirements to the statement date with result S must provide an additional determination for the prior model office based on the Discount Rate *DR*, run D.

Standard Scenario Run	Guideline Variations	Validation Measures	
		Model Office Projection	Projection of Prior Inforce
A. Valuation on the statement date on inforce contracts with discount rate <i>DR</i>	None	None	None
B. Valuation on the statement date on the model office with discount rate <i>DR</i>	If not material to model office validation	A/B compare to 1.00	None
C. Valuation on a prior inforce date on prior inforce contracts with discount rate <i>DR</i>	If not material to projection validation	None	A/C - S/PS compare to 0
D. Valuation on a prior inforce date on a model office with discount rate <i>DR</i>	If not material to model office or projection validation.	(A/D – S/PM) compare to 0	

Modification of the requirements in section A3.3) when applied to a prior inforce or a model office is permitted if such modification facilitates validating the projection of inforce or the model office. All such modifications should be documented.

A3.2) Basic and Basic Adjusted Reserve - Application of Actuarial Guideline XXXIII

- A) The Basic Reserve for a given contract shall be determined by applying statutory statement valuation requirements applicable immediately prior to adoption of the Guideline to the contract ignoring any guaranteed death benefits in excess of account values or guaranteed living benefits applying proceeds in excess of account values.
- B) The calculation of the Basic Reserve shall assume a return on separate account assets based on the year of issue statutory valuation rate less appropriate asset based charges, including charges for any guaranteed death benefits or guaranteed living benefits. It shall also assume a return for any fixed separate account and general account options equal to the rates guaranteed under the contract.
- C) The Basic Reserve shall be no less than the Cash Surrender Value on the valuation date, as defined in Section III)B) of the Guideline.
- D) The Basic Adjusted Reserve shall be that determined based on A3.2)A) and A3.2)B) except in A3.2)A) free partial withdrawal provisions shall be disregarded when determining surrender charges in applying the statutory statement valuation requirement prior to adoption of the Guideline. Section A3.2)C) shall not apply to the Basic Adjusted Reserve.

A3.3) Standard Scenario Reserve - Application of the Standard Scenario Method

- A) General. Where not inconsistent with the guidance given here, the process and methods used to determine the Standard Scenario Reserve under the Standard Scenario Method shall be the same as required in the calculation of the Conditional Tail Expectation Amount as described in Section IV) of the Guideline. Any additional assumptions needed to determine the Standard Scenario Reserve shall be explicitly documented.
- B) Results for the Standard Scenario Method. For each contract, the Standard Scenario Reserve is the reserve based on 1) or 2) where:
- 1) For contracts without any guaranteed benefits, as defined in Section III)A) of the Guideline and where not subsequently disapproved by the Domiciliary Commissioner, the Standard Scenario Reserve is the Basic Reserve described in section A3.2)A), A3.2)B) and A3.2)C).
 - 2) For all other contracts the Standard Scenario Reserve is equal to the greater of Cash Surrender Value on the valuation date, as defined in Section III)B) of the Guideline, and the quantity a) + b) - c), where:
 - a) Is the Basic Adjusted Reserve calculated for the contract, as described in section A3.2)D);
 - b) Is the greater of zero and the greatest present value at the Discount Rate measured as of the end of each projection year of the negative of the Accumulated Net Revenue described below using the assumptions described in A3.3)C). The Accumulated Net Revenue at the end of a projection year is equal to (i) + (ii) - (iii), where:
 - (i) Is the Accumulated Net Revenue at the end of the prior projection year accumulated at the Discount Rate to the end of the current projection year; the Accumulated Net Revenue at the beginning of the projection (i.e., time 0) is zero;
 - (ii) Are the margins generated during the projection year on account values accumulated at the Discount Rate to the end of the projection year (the factors and assumptions to be used in calculating the margins and account values are in A3.3)C)); and
 - (iii) Are the contract benefits in excess of account values applied, Individual reinsurance premiums and Individual reinsurance benefits payable or receivable during the projection year accumulated at the Discount Rate to the end of the projection year. Individual reinsurance is defined in A3.3)C)2).
 - c) Is the contract's allocation of the value of hedges and Aggregate reinsurance as described in section A3.3)D). Aggregate reinsurance is defined in section A3.3)C)2).

No reinsurance shall be considered in the Standard Scenario Amount if such reinsurance does not meet the statutory requirements that would allow the treaty to be accounted for as reinsurance. The actuary shall determine the projected reinsurance premiums and benefits reflecting all treaty limitations and assuming any options in the treaty to the other party are exercised to decrease the value of reinsurance to the reporting company (e.g., options to increase premiums or terminate coverage). The positive value of any reinsurance treaty that is not guaranteed to the insurer or its successor shall be excluded from the value of reinsurance. The commissioner may require the exclusion of a reinsurance treaty or any portion of a reinsurance treaty if the terms of the

reinsurance) treaty or the portion required to be excluded serves solely to reduce the calculated Standard Scenario Reserve without also reducing risk on scenarios similar to those used to determine the Conditional Tail Expectation Reserve. Any reinsurance reflected in the Standard Scenario Reserve shall be appropriate to the business and not merely constructed to exploit ‘foreknowledge’ of the components of the Standard Scenario Method.

C) Assumptions for use in paragraph A3.3)B)2)b) for Accumulated Net Revenue and Account Values.

- 1) Account Value Return Assumptions. The bases for return assumptions on assets supporting the Account Value are shown in Table I. The “Initial” returns shall be applied to the account value supported by each asset class on the valuation date as immediate drops, resulting in the Account Value at time 0. The “Year 1,” “Years 2 – 5,” and “Year 6+” returns for the equity, bond and balanced classes are gross annual effective rates of return and are used (along with other decrements and/or increases) to produce the Account Value as of the end of each projection interval. For purposes of this section, money market funds supporting Account Value shall be considered part of the Bond class.

The Fixed Fund rate is the greater of the minimum rate guaranteed in the contract or 4% but not greater than the current rates being credited to Fixed Funds on the valuation date.

Account Values shall be projected using the appropriate gross rates from Table I for equity, bond and balanced classes applied to the supporting assets less all fund and contract charges according to the provisions of the funds and contract and applying the Fixed funds rate from Table I as if it were the resulting net rate after deduction for fund or contract charges.

The annual margins on Account Value are defined as follows:

- a) During the Surrender Charge Amortization Period, as determined following the step outlined in section A3.3)E) below:
- (i) 0.20% of Account Value; plus
 - (ii) Any Net Revenue Sharing Income, as defined in section A1.1)E), that is contractually guaranteed to the insurer and its liquidator, receiver, and statutory successor; plus
 - (iii) For all of the guaranteed living benefits of a given contract combined,¹⁴ the greater of:
 - 0.20% of Account Value; or
 - Explicit and optional contract charges for guaranteed living benefits; plus
 - (iv) For all guaranteed death benefits of a given contract combined,¹⁵ the greater of:
 - 0.20% of Account Value; or
 - Explicit and optional contract charges for guaranteed death benefits.
- b) After the Surrender Charge Amortization Period:

¹⁴ This excludes any guaranteed living benefit that is added to the contract simply for the purpose of increasing the revenue allowed under this section.

¹⁵ This excludes any guaranteed death benefit that is added to the contract simply for the purpose of increasing the revenue allowed under this section.

The amount determined in a) above; plus 50% of the excess, if any, of all contract charges (excluding Net Revenue Sharing Income) over the sum of a)(i) , a)(iii) and a)(iv) above.

However, on fixed funds after the surrender charge period, a margin of up to the amount in a) above plus .4% may be used.

Table I

	Initial	Year 1	Years 2 – 5	Year 6+
Equity Class	-13.5%	0%	4.0%	5.50%
Bond Class	0%	0%	4.85%	4.85%
Balanced Class	-8.1%	0%	4.34%	5.24%
Fixed Separate Accounts and General Account (net)	0%	Fixed Fund Rate	Fixed Fund Rate	Fixed Fund Rate

- 2) Reinsurance Credit. Individual reinsurance is defined as reinsurance where the total premiums for and benefits of the reinsurance can be determined by applying the terms of the reinsurance to each contract covered without reference to the premiums or benefits of any other contract covered and summing the results over all contracts covered. Reinsurance that is not Individual is Aggregate.

Individual reinsurance premiums projected to be payable on ceded risk and receivable on assumed risk shall be included in the Projected Net Revenue. Similarly, Individual reinsurance benefits projected to be receivable on ceded risk and payable on assumed risk shall be included in the Projected Net Revenue. No Aggregate reinsurance shall be included in Projected Net Revenue.

- 3) Lapses, Partial Withdrawals, and In-The-Moneyness. Partial withdrawals elected as guaranteed living benefits, see A3.3)C)7), or required contractually (e.g., a contract operating under an automatic withdrawal provision on the valuation date) are to be deducted from the Account Value in each projection interval consistent with the projection frequency used, as described in A3.3)C)6), and according to the terms of the contract. No other partial withdrawals, including free partial withdrawals, are to be deducted from Account Value. All lapse rates should be applied as full contract surrenders.

For purposes of determining the dynamic lapse assumptions shown in Table II below, a guaranteed living benefit is in the money (ITM) for any projection interval if the Account Value at the beginning of the projection interval is less than the Current Value of the guaranteed living benefit (as defined below) also at the beginning of that projection interval.

The Current Value of the guaranteed living benefit at the beginning of any projection interval is either the amount of the current lump sum payment (if exercisable) or the present value of future lump sum or income payments. More specific guidance is provided below. For the purpose of determining the present value, the discount rate shall be equal *DR* as defined in A3.1)B)2). If future living benefit payments are life contingent (i.e., either the right of future exercise or the right to future income benefits expires with

the death of the annuitant or the owner), then the company shall determine the present value of such payments using the mortality table specified in A3.3)C)5).

If a guaranteed living benefit is exercisable (withdrawal can start or, in the case of a GMWB, has begun) at the beginning of the projection interval, then the Current Value of the guaranteed living benefit shall be determined assuming immediate or continued exercise of that benefit.

If a guaranteed living benefit is not exercisable (e.g., due to minimum age or duration requirements) at the beginning of that projection interval, then the Current Value of the guaranteed living benefit shall be determined assuming exercise of the guaranteed living benefit at the earliest possible future projection interval. If the right to exercise the guaranteed living benefit is contingent on the survival of the annuitant or the owner, then the Current Value of the guaranteed living benefit shall assume survival to the date of exercise using the mortality table specified in A3.3)C)5).

Determination of the Current Value of a guaranteed living benefit that is exercisable or payable at a future projection interval shall take account of any guaranteed growth in the basis for the guarantee (e.g., where the basis grows according to an index or an interest rate).

For a GMWB, the Current Value shall be determined assuming the earliest penalty-free withdrawal of guaranteed benefits after withdrawals begin and by applying the constraints of any applicable maximum or minimum withdrawal provisions. If the GMWB is currently exercisable and the right to future GMWB payments is contingent upon the survival of the annuitant or owner, then the Current Value shall assume survival using the mortality table specified in A3.3)C)5). After a GMWB that has payments that are contingent upon the survival of the annuitant or owner has commenced, then the Current Value shall assume survival using the Annuity 2000 Mortality Table.

For an unexercised GMIB, the Current Value shall be determined assuming the option with a reserve closest to the reserve for a 10 year certain and life option. The reserve values and the value of the GMIB on the assumed date of exercise shall be determined using the discount rate *DR* specified in A3.1)B)2) and for life contingent payments, the Annuity 2000 Mortality Table. The Current Value of an unexercised GMIB, however, shall be set equal to the Account Value if the contractholder can receive higher income payments on the assumed date of exercise by electing the same option under the normal settlement option provisions of the contract.

For the purpose of applying the lapse assumptions specified in Table II below or contractholder elections rates specified in A3.3)C)7), the contract shall be considered “out of the money” (OTM) for a projection interval if the Current Value of the guaranteed living benefit at the beginning of the projection interval is less than or equal to the Account Value at the beginning of the same projection interval. If the Current Value of the guaranteed living benefit at the beginning of the projection interval is greater than the Account Value also at the beginning of the projection interval, the contract shall be considered ‘in the money’ (ITM) and the percent ITM shall equal:

$$100 * ((\text{Current Value of the guaranteed living benefit} / \text{Account Value}) - 1)$$

If a contract has multiple living benefit guarantees then the guarantee having the largest Current Value shall be used to determine the percent in the money.

Table II - Lapse Assumptions

	During Surrender Charge Period	After Surrender Charge Period		
		ITM < 10%	10% <= ITM < 20%	20% <= ITM
Death Benefit Only Contracts	5%	10%		
All Guaranteed Living Benefits OTM	5%	10%		
		ITM < 10%	10% <= ITM < 20%	20% <= ITM
Any Guaranteed Minimum Accumulation Benefit ITM	2%	2%	0%	0%
Any Other Guaranteed Living Benefits ITM	3%	7%	5%	2%

- 4) Account Transfers and Future Deposits. No transfers between funds shall be assumed in the projection used to determine the greatest present value amount required under section A3.3)B)2)b) unless required by the contract (e.g., transfers from a dollar cost averaging fund or contractual rights given to the insurer to implement a contractually specified portfolio insurance management strategy or a contract operating under an automatic re-balancing option). When transfers must be modeled, to the extent not inconsistent with contract language, the allocation of transfers to funds must be in proportion to the contract's current allocation to funds.

Margins generated during a projection interval on funds supporting account value are transferred to the Accumulation of Net Revenue and are subsequently accumulated at the Discount Rate. Assets for each class supporting account values are to be reduced in proportion to the amount held in each asset classes at the time of transfer of margins or any portion of Account Value applied to the payment of benefits.

No future deposits to Account Value shall be assumed unless required by the terms of the contract to prevent contract or guaranteed benefit lapse, in which case they must be modeled. When future deposits must be modeled, to the extent not inconsistent with contract language, the allocation of the deposit to funds must be in proportion to the contract's current allocation to such funds.

- 5) Mortality. Mortality at 70% of the 1994 Variable Annuity MGDB Mortality Tables (1994 MGDB tables) through age 85 increasing by 1% each year to 100% of the 1994 MGDB tables at age 115 shall be assumed in the projection used to determine the greatest present value amount required under section A3.3)B)2)b).
- 6) Projection Frequency. The projection used to determine the greatest present value amount required under section A3.3)B)2)b) shall be calculated using an annual or more frequent time step, such as quarterly. For time steps more frequent than annual, assets supporting Account Values at the start of a year may be retained in such funds until year-end (i.e., margin earned during the year will earn the fund rates instead of the Discount Rate until year end) or removed after each time step. However, the same approach shall be applied for all years. Similarly, projected benefits, lapses, elections and other contractholder activity can be assumed to occur annually or at the end of each time step, but the approach shall be consistent for all years.

- 7) Contractholder Election Rates. Contractholder election rates for exercisable ITM guaranteed living benefits other than GMWBs shall be 5% per annum in every projection interval where the living benefit is less than 10% ITM, 15% per annum in every projection interval where the living benefit is 10% or more ITM and less than 20% ITM, and 25% per annum in every projection interval where the living benefit is more than 20% ITM. In addition, the election rate for an exercisable ITM guaranteed living benefit shall be 100% at the last model duration to elect such benefit. This 100% election rate shall be used when a Guaranteed Minimum Accumulation Benefit is at the earliest date that the benefit is exercisable and in-the-money. However, the contractholder election rate for any exercisable ITM guaranteed living benefit shall be zero if exercise would cause the extinction of a guaranteed living benefit having a larger Current Value. For this purpose, GMDBs are not benefits subject to election.

For guaranteed minimum withdrawal benefits, a partial withdrawal, if allowed by contract provisions, equal to the applicable percentage in Table III applied to the contract's maximum allowable partial withdrawal shall be assumed. However, if the contract's minimum allowable partial withdrawal exceeds the partial withdrawal from applying the rate in Table III to the contract's maximum allowable partial withdrawal, then the contract's minimum allowable partial withdrawal shall be assumed.

	Attained Age less than 50	Attained Age 50 to 59	Attained Age 60 or Greater
Withdrawals do not reduce other elective Guarantees that are in the money	50%	75%	100%
Withdrawals reduce elective Guarantees that are in the money	25%	50%	75%

- 8) Indices. If an interest index is required to determine projected benefits or reinsurance obligations, the index must assume interest rates have not changed since the last reported rates before the valuation date. If an equity index is required the index shall be consistent with the last reported index before the valuation date, the initial drop in equity returns and the subsequent equity returns in the standard scenario projection. The sources of information and how they are used to determine the indexes shall be documented and, to the extent possible, consistent from year to year.
- D) Assumptions for use in Section A3.3)B)2)c).

- 1) The Value of Aggregate Reinsurance. The value of Aggregate reinsurance shall be calculated separately from the Accumulated Net Revenue. The value of Aggregate reinsurance is the discounted value, using the statutory valuation rate described in the following paragraph, of the excess of (a) the projected benefit payments from the reinsurance; over (b) the projected gross reinsurance premiums, where (a) and (b) are determined under the assumptions described in section A3.3)C) for all applicable contracts in aggregate.

In order for the value of the Aggregate reinsurance to be consistent with the underlying Standard Scenario reserve, the discount rate shall be a weighted average of the valuation

rates (*DR*) of the contracts that are supported by the Aggregate reinsurance treaty. The weights used to determine this discount rate shall be reasonably related to the risks that are being covered by the Aggregate reinsurance (e.g., account value or values of guaranteed benefits) and shall be applied consistently from year to year. If an appropriate method to determine this discount rate does not exist, the value of the Aggregate reinsurance shall be determined using the statutory valuation rate in effect on the valuation date for annuities valued on an issue year basis using Plan Type A and a Guarantee Duration greater than 10 years but not more than 20 years, determined assuming there are cash settlement options but no interest guarantees on future premiums.

- 2) The Value of Approved Hedges. The value of approved hedges shall be calculated separately from the Accumulated Net Revenue. The value of approved hedges is the difference between: a) the discounted value at the 1-year CMT¹⁶ as of the valuation date of the pre-tax cash flows from the approved hedges; less b) their statement values on the valuation date.

To be an approved hedge for purposes of the Standard Scenario Reserve, a derivative or other investment has to be an actual asset held by the company on the valuation date, be used as a hedge supporting the contracts falling under the scope of the Guideline, and comply with any statutes, laws, or regulations (including applicable documentation requirements) of the domiciliary state or jurisdiction related to the use of derivative instruments.

The Domiciliary Commissioner may require the exclusion of any portion of the value of approved hedges upon a finding that the company's documentation, controls, measurement, execution of strategy or historical results are not adequate to support a future expectation of risk reduction commensurate with the value of approved hedges.

The cash flow projection for approved hedges that expire in less than one year from the valuation date should be based on holding the hedges to their expiration. For hedges with an expiration of more than 1 year, the value of hedges should be based on liquidation of the hedges one year from the valuation date. Where applicable, the liquidation value of hedges shall be consistent with the assumed returns in the Standard Scenario from the start of the projection to the date of liquidation, Black-Scholes pricing, a risk free rate equal to the 5-year CMT as of the valuation date and the annual volatility implicit as of the valuation date in the statement value of the hedges when the statement value of hedges are valued with Black-Scholes pricing and a risk-free rate equal to the 5-year CMT as of the valuation date.¹⁷

There is no credit in the Standard Scenario for dynamic hedging beyond the credit that results from hedges actually held on the valuation date.

¹⁶ For purposes of this Appendix, the term CMT refers to the nominal yields on actively traded non-inflation-indexed issues adjusted to constant maturities, as released daily by the Federal Reserve Board. As of this writing, the current and historical one-year rates may be found at http://www.federalreserve.gov/releases/h15/data/Business_day/H15_TCMNOM_Y1.txt and the current and historical five-year rates may be found at http://www.federalreserve.gov/releases/h15/data/Business_day/H15_TCMNOM_Y5.txt.

¹⁷ Conceptually, the item being hedged, the contract guarantees, and the approved hedges are accounted for at the average present value of the worst 30% of all scenarios, the tail scenarios for a CTE (70) measure. However, the statement value of approved hedges is at market. Therefore, the standard scenario value of approved hedges is a proxy of the adjustment needed to move approved hedges from a market value to a tail value.

- 3) Allocation of the Value of Hedges and the Value of Aggregate Reinsurance. The value of approved hedges and Aggregate reinsurance shall be allocated to the contracts which are supported by the applicable Aggregate reinsurance agreements and approved hedges. A contract's allocation shall be the lesser of the amount in A3.3)B)2)b) for the contract or the product of a) and b) where:
 - a) Is the sum of the value of the applicable approved hedges plus the value of the applicable Aggregate reinsurance for all contracts supported by the same hedges and/or the Aggregate reinsurance agreement; and
 - b) Is the ratio of the amount in A3.3)B)2)b) for the contract to the sum of the amount in A3.3)B)2)b) for all contracts supported by the same hedges and/or the Aggregate reinsurance agreement.
 - 4) Retention of components. For the seriatim Standard Scenario Reserve on the statement date under each of Sections A3.1)B)1) and A3.1)B)2), the actuary should have available to the Commissioner the following values for each contract:
 - a) The Standard Scenario Reserve prior to adjustment under paragraph A3.3)D)3)
 - b) The Standard Scenario Reserve net of the adjustment in A3.3)D)3).
- E) Determination of the Surrender Charge Amortization Period to be used in section A3.3)C)1)a) and b).

The purpose of the Surrender Charge Amortization Period is to help determine how much of the surrender charge is amortized in the Basic Adjusted Reserve portion of the Standard Scenario Amount and how much needs to be amortized in the Accumulated Net Revenue portion. Once determined, the Surrender Charge Amortization Period determines the duration over which the lower level of margins, as described in A3.3)C)1)a), is used. After that duration, the higher level of margins, as described in A3.3)C)1)b), is used.

A separate Surrender Charge Amortization Period is determined for each contract and is based on amounts determined in the calculation of the Basic Adjusted Reserve for that contract. A key component of the calculation is the amount of the surrender charge that is not amortized in the Basic Adjusted Reserve calculation for that contract. This is represented by the difference between the account value and the cash surrender value projected within the Basic Adjusted Reserve calculation for the contract.

The Surrender Charge Amortization Period for a given contract is determined by following the steps:

- 1) Measure the duration of the greatest present value used in the Basic Adjusted Reserve. The Basic Adjusted Reserve is determined for a contract by taking the greatest present value of a stream of projected benefits. The benefit stream that determines the greatest present value typically includes an "ultimate" event (e.g., 100% surrender, 100% annuitization, or maturity). The "BAR Duration" is the length of time between the valuation date and the projected "ultimate" event.
- 2) Determine the amount of the surrender charge not amortized in the Basic Adjusted Reserve. The surrender charge not amortized in the Basic Adjusted Reserve is the difference between the projected account value and the projected cash surrender value at the BAR Duration (i.e., at the time of that projected "ultimate" event). This value for a given contract shall not be less than zero.

- 3) Determine the Surrender Charge Amortization Period before rounding. This equals a) time b) plus c), where:
- a) Equals the ratio of the amount determined in step 2 to the Account Value on the valuation date;
 - b) Equals 100; and
 - c) Equals the BAR Duration determined in step 1.
- 4) Determine the Surrender Charge Amortization Period for the contract. This is the amount determined in step 3, rounded to the nearest number that represents a projection duration, taking into account the projection frequency described in A3.3C)6). For example, step 3 produces a value of 2.15 and the projection frequency is quarterly, the Surrender Charge Amortization Period for the contract is 2.25.

Not for Distribution

APPENDIX 4 - Alternative Methodology

A4.1) General Methodology

- A) General Methodology Description. For variable deferred annuity contracts that either contain no guaranteed benefits or only GMDBs¹⁸ (i.e., no VAGLBs), the Conditional Tail Expectation Amount may be determined by using the method outlined below rather than by using the approach described in Section IV)D) (i.e., based on projections), provided the approach described in Section IV)D) has not been used in prior valuations or else approval has been obtained from the Domiciliary Commissioner.

The Conditional Tail Expectation Amount determined using the Alternative Methodology for a group of contracts with GMDBs shall be determined as the sum of amounts obtained by applying factors to each contract in force as of a valuation date and adding this to the contract's Cash Surrender Value.¹⁹ The resulting Conditional Tail Expectation Amount shall not be less than the Cash Surrender Value in aggregate for the group of contracts to which the Alternative Methodology is applied.

The Conditional Tail Expectation Amount determined using the Alternative Methodology for a group of contracts that contain no guaranteed benefits²⁰ shall be determined using an application of Actuarial Guideline XXXIII, as described below.

For purposes of performing the Alternative Methodology, materially similar contracts within the group may be combined together into subgroups to facilitate application of the factors. Specifically, all contracts comprising a "subgroup" must display substantially similar characteristics for those attributes expected to affect reserves (e.g., definition of guaranteed benefits, attained age, contract duration, years-to-maturity, market-to-guaranteed value, asset mix, etc.). Grouping shall be the responsibility of the actuary but may not be done in a manner that intentionally understates the resulting reserve.

- B) Definitions of Terms Used in this Appendix.

- 1) Annualized Account Charge Differential. This term is the charge as percentage account value (revenue for the company) minus the expense as percentage of account value.
- 2) Asset Exposure. Asset Exposure refers to the greatest possible loss to the insurance company from the value of assets underlying general or separate account contracts falling to zero.
- 3) Benchmark. Benchmarks have similar risk characteristics to the entity (e.g., asset class, index, or fund) to be modeled.
- 4) Deterministic Calculations. In a Deterministic Calculation, a given event (e.g., asset returns going up by 7% then down by 5%) is assumed to occur with certainty. In a stochastic calculation, events are assigned probabilities.

¹⁸ This includes "earnings enhanced death benefits," as discussed in Section III(A)1).

¹⁹ The amount that is added to a contract's Cash Surrender Value may be negative, zero or positive, thus resulting in a reserve for a given contract that could be less than, equal to, or greater than, the Cash Surrender Value.

²⁰ The term "contracts that contain no guaranteed benefits" means that there are no guaranteed benefits at any time during the life of the contract (past, present or future).

- 5) Foreign Securities. Securities issued by entities outside the United States and Canada.
- 6) Grouped Fund Holdings. Grouped Fund Holdings relate to guarantees that apply across multiple deposits or for an entire contract instead of on a deposit-by-deposit basis.
- 7) Guaranteed Value. The Guaranteed Value is the benefit base or a substitute for the account value (if greater than the account value) in the calculation of living benefits or death benefits. The methodology for setting the Guaranteed Value is defined in the variable annuity contract.
- 8) High-Yield Bonds. High-Yield Bonds are below investment grade, with NAIC designations (if assigned) of 3, 4, 5, or 6. Compared to investment grade bonds, these bonds have higher risk of loss due to credit events. Funds containing securities predominately containing securities that are not NAIC designated as 1 or 2 (or similar agency ratings) are considered to be High-Yield.
- 9) Investment Grade Fixed Income Securities. Securities with NAIC designations of 1 or 2 are Investment Grade. Funds containing securities predominately with NAIC designations of 1 or 2 or with similar agency ratings are considered to be Investment Grade.
- 10) Liquid Securities. These securities can be sold and converted into cash at a price close to its true value in a short period of time.
- 11) Margin Offset. Margin Offset is the portion of charges plus any Revenue Sharing allowed under section A1.1)E) available to fund claims and amortization of the unamortized surrender charges allowance.
- 12) Multi-Point Linear Interpolation. This methodology is documented in mathematical literature and calculates factors based on multiple attributes categorized with discrete values where the attributes' actual values may be between the discrete values.
- 13) Model Office. A Model Office converts many contracts with similar features into one contract with specific features for modeling purposes.
- 14) Pre-Packaged Scenarios. The Pre-Packaged Scenarios are the year-by-year asset returns that may be used (but are not mandated) in projections related to the alternative methodology. These scenarios are available on an American Academy of Actuaries website.
- 15) Quota-Share Reinsurance. In this type of reinsurance treaty, the same proportion is ceded on all cessions. The reinsurer assumes a set percentage of risk for the same percentage of the premium, minus an allowance for the ceding company's expenses.
- 16) Resets. A Reset benefit results in a future minimum guaranteed benefit being set equal to the contract's account value at previous set date(s) after contract inception.
- 17) Risk Mitigation Strategy. A Risk Mitigation Strategy is a device to reduce the probability and/or impact of a risk below an acceptable threshold.
- 18) Risk Profile. Risk Profile in the Guideline relates to the prescribed asset class categorized by the volatility of returns associated with that class.

- 19) Risk Transfer Arrangements. A Risk Transfer Arrangement shifts risk exposures (e.g., the responsibility to pay at least a portion of future contingent claims) away from the original insurer.
 - 20) Roll-Up. A Roll-Up benefit results in the guaranteed value associated with a minimum contractual guarantee increasing at a contractually defined interest rate.
 - 21) Volatility. Volatility refers to the annualized standard deviation of asset returns.
- C) Contract-by-Contract Application for Contracts that Contain No Guaranteed Living or Death Benefits. The Alternative Methodology reserve for each contract that contains no guaranteed living or death benefits shall be determined by applying Actuarial Guideline XXXIII. The application shall assume a return on separate account assets equal to the year of issue valuation interest rate less appropriate asset based charges. It shall also assume a return for any fixed separate account and general account options equal to the rates guaranteed under the contract.

The reserve for such contracts shall be no less than the Cash Surrender Value on the valuation date, as defined in Section III)B).

- D) Contract-by-Contract Application for Contracts that Contain GMDBs only. For each contract, factors are used to determine a dollar amount, equal to $R \times (CA + FE) + GC$ (as described below), that is to be added to that contract's Cash Surrender Value as of the valuation date. The dollar amount to be added for any given contract may be negative, zero, or positive. The factors that are applied to each contract shall reflect the following attributes as of the valuation date:
- 1) The contractual features of the variable annuity product,
 - 2) The actual issue age, period since issue, attained age, years-to-maturity, and gender applicable to the contract,
 - 3) The account value and composition by type of underlying variable or fixed fund,
 - 4) Any surrender charges,
 - 5) The GMDB and the type of adjustment made to the GMDB for partial withdrawals (e.g., proportional or dollar-for-dollar adjustment), and
 - 6) Expenses to be incurred and revenues to be received by the company as estimated on a Prudent Estimate basis as described in Section III)B)8) and complying with the requirements for Revenue Sharing as described in section A1.1)E).
- E) Factor Components. Factors shall be applied to determine each of the following components.²¹

CA = Provision for amortization of the unamortized surrender charges calculated by the insurer based on each contract's surrender charge schedule, using prescribed assumptions, except that lapse rates shall be based on the insurer's Prudent Estimate, but with no provision for Federal Income Taxes or mortality;

²¹ Material to assist in the calculation of the components is available on the American Academy of Actuaries' website, at <http://www.actuary.org/life/phase2.asp>.

- FE* = Provision for fixed dollar expenses less fixed dollar revenue calculated using prescribed assumptions, the contract's actual expense charges, the insurer's anticipated actual expenses and lapse rates, both estimated on a Prudent Estimate basis, and with no provision for Federal Income Taxes or mortality;
- GC* = Provision for the costs of providing the GMDB less net available spread-based charges determined by the formula $F \times GV - G \times AV \times R$, where *GV* and *AV* are as defined in section A4.3)A);
- R* = A scaling factor that is a linear function of the ratio of the margin offset to Total Account Charges (*W*) and takes the form $R(\beta_0, \beta_1) = \beta_0 + \beta_1 \times W$. The intercept and slope factors for this linear function vary according to:
- a) Product type,
 - b) Pro-rata or dollar-for-dollar reductions in guaranteed value following partial withdrawals,
 - c) Fund class,
 - d) Attained age,
 - e) Contract duration,
 - f) Asset-based charges, and
 - g) 90% of the ratio of account value to guaranteed value, determined in the aggregate for all contracts sharing the same product characteristics.

Tables of factors for *F*, *G*, β_0 , and β_1 values, reflecting a 65% confidence level and ignoring Federal Income Tax, are available from the National Association of Insurance Commissioners. In calculating $R(\beta_0, \beta_1)$ directly from the linear function provided above, the margin ratio *W* must be constrained to values greater than or equal to 0.2 and less than or equal to 0.6.

Interpolated values of *F*, *G* and *R* (calculated using the linear function described above) for all contracts having the same product characteristics and asset class shall be derived from the pre-calculated values using multi-point linear interpolation over the following four contract-level attributes:

- 1) Attained age,
- 2) Contract duration,
- 3) Ratio of account value to GMDB, and
- 4) The total of all asset based charges, including any fund management fees or allowances based on the underlying variable annuity funds received by the insurer.

The gross asset-based charges for a product shall equal the sum of all contractual asset-based charges plus fund management fees or allowances based on the underlying variable annuity funds received by the insurer determined by complying with the requirements for Prudent Estimate described in Section III)B)8) and Revenue Sharing described in section A1.1)E). Net asset-based charges equal gross asset-based charges less any company expenses assumed to be incurred expressed as a percentage of account value. All expenses that would be assumed if the Conditional Tail Expectation Amount were being computed as described in section A1.1)A) should be reflected either in the calculation of the net asset based charges or in the expenses reflected in the calculation of the amount *FE*.

No adjustment is made for Federal Income Taxes in any of the components listed above.

For purposes of determining the Conditional Tail Expectation Amount using the Alternative Methodology, any interpretation and application of the requirements of the Guideline shall follow the principles discussed in the Section I) Background.

A4.2) Calculation of CA and FE

- A) General Description. Components *CA* and *FE* shall be calculated for each contract, thus reflecting the actual account value and GMDB, as of the valuation date, which is unique to each contract.

Components *CA* and *FE* are defined by deterministic “single-scenario” calculations that account for asset growth, interest and inflation at prescribed rates. Mortality is ignored for these two components. Lapse rates shall be determined on a Prudent Estimate basis as described in Section III)B)8). Lapse rates shall be adjusted by the formula shown below (the Dynamic Lapse Multiplier, λ), which bases the relationship of the GMDB (denoted as *GV* in the formula) to the account value (denoted as *AV* in the formula) on the valuation date. Thus, projected lapse rates are smaller when the GMDB is greater than the account value and larger when the GMDB is less than the account value.

$$\lambda = \text{MIN} \left[U, \text{MAX} \left[L, 1 - M \times \left(\frac{GV}{AV} - D \right) \right] \right],$$

where $U=1$, $L=0.5$, $M=1.25$, and $D=1.1$.

Present values shall be computed over the period from the valuation date to contract maturity at a discount rate of 5.75%.

Projected fund performance underlying the account values is as shown in the table below. Unlike the *GC* component, which requires the entire account value to be mapped, using the Fund Categorization Rules set forth in section A4.4, to a single “equivalent” asset class (as described in A4.4C)), the *CA* and *FE* calculation separately projects each variable subaccount (as mapped to the 8 prescribed categories shown in section A4.4)) using the net asset returns shown in the following table. If surrender charges are based wholly on deposits or premiums as opposed to account value, use of this table may not be necessary.

Asset Class / Fund	Net Annualized Return
Fixed Account	Guaranteed Rate
Money Market	0%
Fixed Income (Bond)	0%
Balanced	-1%
Diversified Equity	-2%
Diversified International Equity	-3%
Intermediate Risk Equity	-5%
Aggressive or Exotic Equity	-8%

- B) Component CA. Component *CA* is computed as the present value of the projected change in surrender charges plus the present value of an implied borrowing cost of 25 basis points at the beginning of each future period applied to the surrender charge at such time.

This component can be interpreted as the “amount needed to amortize the unamortized surrender charge allowance for the *persisting* policies plus the implied borrowing cost.” By definition, the amortization for non-persisting lives in each time period is exactly offset by the collected surrender charge revenue (ignoring timing differences and any waiver upon death). The unamortized balance must be projected to the end of the surrender charge period using the net asset returns and Dynamic Lapse Multiplier, λ , both as described above and the year-by-year amortization discounted also as described above. For simplicity, mortality is ignored in the calculations. Surrender charges and free partial withdrawal provisions are as specified in the contract. Lapse and withdrawal rates are determined on a Prudent Estimate basis, and may vary according to the attributes of the business being valued, including, but not limited to, attained age, contract duration, etc.

- C) Component FE. Component *FE* establishes a provision for fixed dollar expenses (e.g., allocated costs, including overhead expressed as “per contract” and those expenses defined on a “per contract” basis) less any fixed dollar revenue (e.g., annual administrative charges or contract fees) through the earlier of contract maturity or 30 years. *FE* is computed as the present value of the company’s assumed fixed expenses projected at an assumed annual rate of inflation starting in the second projection year. This rate grades uniformly from the current inflation rate (“CIR”) into an ultimate inflation rate of 3% per annum in the 8th year after the valuation date. The CIR is the greater of 3% and the inflation rate assumed for expenses in the company’s most recent asset adequacy analysis for similar business.

A4.3) Calculation of the GC Component

- A) GC Factors. *GC* is calculated as $F \times GV - G \times AV \times R$, where *GV* is the amount of GMDB and *AV* is the contract account value, both as of the valuation date. *F*, *G* and the slope and intercept for the linear function used to determine *R* (identified symbolically as β_0 and β_1) are pre-calculated factors available from the National Association of Insurance Commissioners and known herein as the “Pre-Calculated Factors.” These factors shall be interpolated as described in subsection F), below, and modified as necessary as described in sections A4.3)G) and A4.3)H).

- B) Five Steps. There are five major steps in determining the *GC* component for a given contract:

- 1) Classifying the asset exposure (as specified in subparagraph C), below);
- 2) Determining the risk attributes (as specified in subparagraphs D) and E), below);
- 3) Retrieving the appropriate nodal factors from the factor grid (as described in subparagraph F) below;
- 4) Interpolating the nodal factors, where applicable (optional) also as described in subparagraph F), below; and
- 5) Applying the factors to the contract values.

- C) Classifying Asset Exposure. For purposes of calculating *GC* (unlike what is done for components *CA* and *FE*), the entire account value for each contract must be assigned to one of the eight prescribed fund classes shown in section A4.4), using the Fund Categorization rules in section A4.4).

- D) Product Designs. Factors F , G and $R(\beta_1, \beta_2)$ are available within the Pre-Calculated Factors for the following GMDB product designs:
- 1) Return of Premium (“ROP”),
 - 2) Premiums less withdrawals accumulated at 3% per annum, capped at 2.5 times premiums less withdrawals, with no further increase beyond age 80 (“ROLL3”),
 - 3) Premiums less withdrawals accumulated at 5% per annum, capped at 2.5 times premiums less withdrawals, with no further increase beyond age 80 (“ROLL5”),
 - 4) An annual ratchet design (maximum anniversary value), for which the guaranteed benefit never decreases and is increased to equal the previous contract anniversary account value, if larger, with no further increases beyond age 80 (“MAV”),
 - 5) A design having a guaranteed benefit equal to the larger of the benefits in designs 3 and 4, above (“HIGH”),
 - 6) An enhanced death benefit (“EDB”) equal to 40% of the net earnings on the account (i.e., 40% of account value less total premiums paid plus withdrawals made) with this latter benefit capped at 40% of premiums less withdrawals (“EDB”),
- E) Other Attributes. Factors F , G and $R(\beta_1, \beta_2)$ are available within the Pre-Calculated Factors for the following set of attributes:
- 1) Two Partial Withdrawal Rules – one for contracts having a pro-rata reduction in the GMDB and another for contracts having a dollar-for-dollar reduction,
 - 2) The eight asset classes described in section A4.4)B),
 - 3) Eight attained ages, with a 5-year age setback for females,
 - 4) Five contract durations,
 - 5) Seven values of GV/AV , and
 - 6) Three levels of asset-based income.
- F) Interpolation of F , G and $R(\beta_1, \beta_2)$.
- 1) Values of F , G and $R(\beta_1, \beta_2)$ apply to a contract having the product characteristics listed in section A4.5)A) and shall be determined by selecting values for the appropriate partial withdrawal rule and asset class and then using multi-point linear interpolation among published values for the last four attributes shown in section A4.3)E).
 - 2) Interpolation over all four dimensions is not required, but if not performed over one or more dimensions, the factor used must result in a conservative (higher) value of GC . However, simple linear interpolation using the $AV \div GV$ ratio is mandatory. In this case, the company must choose nodes for the other three dimensions according to the following rules: next highest attained age, nearest duration, and nearest Annualized

Account Charge Differential, as listed in A4.5)C) (i.e., capped at +100 and floored at – 100 bps).

- 3) For $R(\beta_1, \beta_2)$, the interpolation should be performed on the Scaling Factors R calculated using β_1, β_2 , using the ratio of Margin Offset to Total Asset Charges (W), not on the factors β_1 and β_2 themselves.
 - 4) An Excel® workbook, Excel® add-in and companion dynamic link library (.dll) program is available from the National Association of Insurance Commissioners that can be used to determine the correct values and perform the multi-point linear interpolation.
 - 5) Alternatively, published documentation can be referenced on performing multi-point linear interpolation and the required sixteen values determined using a key that is documented in the table “*Components of Key Used for GC Factor Look-Up*” located in section A4.5)C).
- G) Adjustments to GC for Product Variations & Risk Mitigation/Transfer. In some cases, it may be necessary to make adjustments to the published factors due to:
- 1) A variation in product form wherein the definition of the guaranteed benefit is materially different from those for which factors are available (see section A4.3)H)); and/or
 - 2) A risk mitigation or other management strategy, other than a hedging strategy, that cannot be accommodated through a straightforward and direct adjustment to the published values.

Adjustments may not be made to GC for hedging strategies.

Any adjustments to the published factors must be fully documented and supported through stochastic analysis. Such analysis may require stochastic simulations, but would not ordinarily be based on full inforce projections. Instead, a representative “model office” should be sufficient. Use of these adjusted factors must be supported by a periodic review of the appropriateness of the assumptions and methods used to perform the adjustments, with changes made to the adjustments when deemed necessary by such review.

Note that minor variations in product design do not necessarily require additional effort. In some cases, it may be reasonable to use the factors/formulas for a different product form (e.g., for a roll-up GMDB near or beyond the maximum reset age or amount, the ROP GMDB factors/formulas shall be used, possibly adjusting the guaranteed value to reflect further resets, if any). In other cases, the reserves may be based on two different guarantee definitions and the results interpolated to obtain an appropriate value for the given contract/cell. Likewise, it may be possible to adjust the Alternative Methodology results for certain risk transfer arrangements without significant additional work (e.g., quota-share reinsurance without caps, floors or sliding scales would normally be reflected by a simple pro-rata adjustment to the “gross” GC results).

However, if the contract design is sufficiently different from those provided and/or the risk mitigation strategy is non-linear in its impact on the Conditional Tail Expectation Amount, and there is no practical or obvious way to obtain a good result from the prescribed factors/formulas, any adjustments or approximations must be supported using stochastic modeling. Notably this modeling need not be performed on the whole portfolio, but can be undertaken on an appropriate set of representative policies.

H) Adjusting F and G for Product Design Variations. This subsection describes the typical process for adjusting F and G factors due to a variation in product design. Note that R (as determined by the slope and intercept terms in the factor table) would not be adjusted.

- 1) Select a contract design among those described in section A4.3)D) that is similar to the product being valued. Execute cash flow projections using the documented assumptions (see table of *Liability Modeling Assumptions & Product Characteristics* in section A4.5)A) and table of *Asset Based Fund Charges* in section A4.5)B)) and the pre-packaged scenarios for a set of representative cells (combinations of attained age, contract duration, asset class, AV/GMDB ratio and asset-based charges). These cells should correspond to nodes in the table of pre-calculated factors. Rank (order) the sample distribution of results for the present value of net cost.²² Determine those scenarios that comprise CTE (65).
- 2) Using the results from step 1, average the present value of cost for the CTE (65) scenarios and divide by the current guaranteed value. For the J^{th} cell, denote this value by F_J . Similarly, average the present value of margin offset revenue for the same subset of scenarios and divide by account value. For the J^{th} cell, denote this value by G_J .
- 3) Extract the corresponding pre-calculated factors. For each cell, calibrate to the published tables by defining a “model adjustment factor” (denoted by asterisk) separately for the “cost” and “margin offset” components:

$$F_J^* = \frac{f(\tilde{\theta})}{F_J} \text{ and } G_J^* = \frac{g(\tilde{\theta})}{G_J}$$

- 4) Execute “product specific” cash flow projections using the documented assumptions and pre-packaged scenarios for the same set of representative cells. Here, the company should model the actual product design. Rank (order) the sample distribution of results for the present value of net cost. Determine those scenarios that comprise CTE (65).
 - 5) Using the results from step 4, average the present value of cost for the CTE (65) scenarios and divide by the current guaranteed value. For the J^{th} cell, denote this value by \bar{F}_J . Similarly, average the present value of margin offset revenue for the same subset of scenarios and divide by account value. For the J^{th} cell, denote this value by \bar{G}_J .
 - 6) To calculate the Conditional Tail Expectation Amount for the specific product in question, the company should implement the Alternative Methodology as documented, but use $\bar{F}_J \times F_J^*$ in place of F and $\bar{G}_J \times G_J^*$ instead of G . The same R factors as appropriate for the product evaluated in step 1 shall be used for this step (i.e., the product used to calibrate the cash flow model).
- I) Adjusting GC for Mortality Experience. The factors that have been developed for use in determining GC assume male mortality at 100% of the 1994 Variable Annuity MGDB ALB Mortality Table. Companies electing to use the Alternative Methodology that have not conducted an evaluation of their mortality experience shall use these factors. Other companies should use the procedure described below to adjust for the actuary’s Prudent Estimate of mortality. The development of Prudent Estimate mortality shall follow the requirements and guidance of

²² Present value of net cost = PV [guaranteed benefit claims in excess of account value] – PV [margin offset]. The discounting includes cash flows in all future years (i.e., to the earlier of contract maturity and the end of the horizon).

Appendix 10. Once a company uses the modified method for a block of business, the option to use the unadjusted factors is no longer available for that part of its business. In applying the factors to actual inforce business, a 5-year age setback should be used for female annuitants.

- 1) Develop a set of mortality assumptions based on Prudent Estimate. In setting these assumptions, the actuary shall be guided by the definition of Prudent Estimate and the principles discussed in Appendices 9 and 10 of the Guideline.
- 2) Calculate two sets of net single premiums (NSP) at each attained age: one valued using 100% of the 1994 Variable Annuity MGDB ALB Mortality Table (with the aforementioned 5-year age setback for females) and the other using Prudent Estimate mortality. These calculations shall assume an interest rate of 3.75% and a lapse rate of 7% per year.
- 3) The *GC* factor is multiplied by the ratio, for the specific attained age being valued, of the NSP calculated using the Prudent Estimate mortality to the NSP calculated using the 1994 Variable Annuity MGDB ALB Mortality Table (with the aforementioned 5-year age setback for females).

A4.4) Fund Categorization

- A) Criteria. The following criteria should be used to select the appropriate factors, parameters and formulas for the exposure represented by a specified guaranteed benefit. When available, the volatility of the long-term annualized total return for the fund(s) – or an appropriate benchmark – should conform to the limits presented. For this purpose, “long-term” is defined as twice the average projection period that would be applied to test the product in a stochastic model (generally, at least 30 years).

Where data for the fund or benchmark are too sparse or unreliable, the fund exposure should be moved to the next higher volatility class than otherwise indicated. In reviewing the asset classifications, care should be taken to reflect any additional volatility of returns added by the presence of currency risk, liquidity (bid-ask) effects, short selling and speculative positions.

- B) Asset Classes. Variable subaccounts must be categorized into one of the following eight (8) asset classes. For purposes of calculating *CA* or *FE*, each contract will have one or more of the following asset classes represented, whereas for component *GC*, all subaccounts will be mapped into a single asset class.
- 1) Fixed Account. This class is credited interest at guaranteed rates for a specified term or according to a ‘portfolio rate’ or ‘benchmark’ index. This class offers a minimum positive guaranteed rate that is periodically adjusted according to company policy and market conditions.
 - 2) Money Market/Short-Term. This class is invested in money market instruments with an average remaining term-to-maturity of less than 365 days.
 - 3) Fixed Income. This class is invested primarily in investment grade fixed income securities. Up to 25% of the funds within this class may be invested in diversified equities or high-yield bonds. The expected volatility of the returns for this class will be lower than the Balanced fund class.

- 4) Balanced. This class is a combination of fixed income securities with a larger equity component. The fixed income component should exceed 25% of the portfolio. Additionally, any aggressive or ‘specialized’ equity component should not exceed one-third (33.3%) of the total equities held. Should the fund violate either of these constraints, it should be categorized as an equity fund. This class usually has a long-term volatility in the range of 8% – 13%.
 - 5) Diversified Equity. This class is invested in a broad-based mix of U.S. and foreign equities. The foreign equity component (maximum 25% of total holdings) must be comprised of liquid securities in well-developed markets. Funds in this class would exhibit long-term volatility comparable to that of the S&P500. These funds should usually have a long-term volatility in the range of 13% – 18%.
 - 6) Diversified International Equity. This class is similar to the Diversified Equity class, except that the majority of fund holdings are in foreign securities. This class should usually have a long-term volatility in the range of 14% – 19%.
 - 7) Intermediate Risk Equity. This class has a mix of characteristics from both the Diversified and Aggressive Equity Classes. This class has a long-term volatility in the range of 19% – 25%.
 - 8) Aggressive or Exotic Equity. This class comprises more volatile funds where risk can arise from: underdeveloped markets, uncertain markets, high volatility of returns, narrow focus (e.g., specific market sector), etc. This class (or market benchmark) either does not have sufficient history to allow for the calculation of a long-term expected volatility, or the volatility is very high. This class would be used whenever the long-term expected annualized volatility is indeterminable or exceeds 25%.
- C) Selecting Appropriate Investment Classes. The selection of an appropriate investment type should be done at the level for which the guarantee applies. For guarantees applying on a deposit-by-deposit basis, the fund selection is straightforward. However, where the guarantee applies across deposits or for an entire contract, the approach can be more complicated. In such instances, the approach is to identify for each contract where the “grouped holdings” fit within the categories listed and to classify the associated assets on this basis.

A seriatim process is used to identify the “grouped” fund holdings, to assess the risk profile of the current fund holdings (possibly calculating the expected long-term volatility of the funds held with reference to the indicated market proxies), and to classify the entire ‘asset exposure’ into one of the specified choices. Here, ‘asset exposure’ refers to the underlying assets (separate and/or general account investment options) on which the guarantee will be determined. For example, if the guarantee applies separately for each deposit year within the contract, then the classification process would be applied separately for the exposure of each deposit year.

In summary, mapping the benefit exposure (i.e., the asset exposure that applies to the calculation of the guaranteed minimum death benefits) to one of the prescribed asset classes is a multi-step process:

- 1) Map each separate and/or general account investment option to one of the prescribed asset classes. For some funds, this mapping will be obvious, but for others it will involve a review of the fund’s investment policy, performance benchmarks, composition and expected long-term volatility.

- 2) Combine the mapped exposure to determine the expected long-term “volatility of current fund holdings.” This will require a calculation based on the expected long-term volatility for each fund and the correlations between the prescribed asset classes as given in the table “*Correlation Matrix for Prescribed Asset Classes*,” in section A4.4)D).
- 3) Evaluate the asset composition and expected volatility (as calculated in step 2) of current holdings to determine the single asset class that best represents the exposure, with due consideration to the constraints and guidelines presented earlier in this section.

In step 1, the company should use the fund’s actual experience (i.e., historical performance, inclusive of reinvestment) only as a guide in determining the expected long-term volatility. Due to limited data and changes in investment objectives, style and/or management (e.g., fund mergers, revised investment policy, different fund managers, etc.); the company may need to give more weight to the expected long-term volatility of the fund’s benchmarks. In general, the company should exercise caution and not be overly optimistic in assuming that future returns will consistently be less volatile than the underlying markets.

In step 2, the company should calculate the “volatility of current fund holdings” (for the exposure being categorized) by the following formula

$$\sigma = \sqrt{\sum_{i=1}^n \sum_{j=1}^n w_i w_j \rho_{ij} \sigma_i \sigma_j}$$

using the volatilities and correlations in the following table where $w_i = \frac{AV_i}{\sum_k AV_k}$ is the relative value of fund i expressed as a proportion of total contract value, ρ_{ij} is the correlation between asset classes i and j and σ_i is the volatility of asset class i. An example is provided after the table.

D) Correlation Matrix for Prescribed Asset Classes.

ANNUAL VOLATILITY		FIXED ACCOUNT	MONEY MARKET	FIXED INCOME	BALANCED	DIVERSE EQUITY	INTL EQUITY	INTERM EQUITY	AGGR EQUITY
1.0%	FIXED ACCOUNT	1	0.50	0.15	0	0	0	0	0
1.5%	MONEY MARKET	0.50	1	0.20	0	0	0	0	0
5.0%	FIXED INCOME	0.15	0.20	1	0.30	0.10	0.10	0.10	0.05
10.0%	BALANCED	0	0	0.30	1	0.95	0.60	0.75	0.60
15.5%	DIVERSE EQUITY	0	0	0.10	0.95	1	0.60	0.80	0.70
17.5%	INTL EQUITY	0	0	0.10	0.60	0.60	1	0.50	0.60
21.5%	INTERM EQUITY	0	0	0.10	0.75	0.80	0.50	1	0.70
26.0%	AGGR EQUITY	0	0	0.05	0.60	0.70	0.60	0.70	1

E) Fund Categorization Example. As an example, suppose three funds (Fixed Income, diversified U.S. Equity and Aggressive Equity) are offered to clients on a product with a contract level guarantee (i.e., across all funds held within the contract). The current fund holdings (in dollars) for five sample contracts are shown in the following table.

	1	2	3	4	5
MV Fund X (Fixed Income):	5,000	4,000	8,000	-	5,000
MV Fund Y (Diversified Equity):	9,000	7,000	2,000	6,000	-
MV Fund Z (Aggressive Equity):	1,000	4,000	-	4,000	5,000
Total Market Value:	15,000	15,000	10,000	10,000	10,000
Total Equity Market Value:	10,000	11,000	2,000	10,000	5,000
Fixed Income % (A):	33%	27%	80%	0%	50%
Fixed Income Test (A>75%):	No	No	Yes	No	No
Aggressive % of Equity (B):	10%	36%	n/a	40%	100%
Balanced Test (A>25% & B<33.3%):	Yes	No	n/a	No	No
Volatility of Current Fund Holdings:	10.9%	13.2%	5.3%	19.2%	13.4%
Fund Classification:	Balanced	Diversified*²³	Fixed Income	Intermediate	Diversified

²³ Although the volatility suggests “Balanced Fund,” the Balanced Fund criteria were not met. Therefore, this ‘exposure’ is moved “up” to Diversified Equity. For those funds classified as Diversified Equity, additional analysis would be required to assess whether they should be instead designated as “Diversified International Equity.”

As an example, the “Volatility of Current Fund Holdings” for contract #1 is calculated as $\sqrt{A+B}$ where:

$$A = \left(\frac{5}{15} \times 0.05\right)^2 + \left(\frac{9}{15} \times 0.155\right)^2 + \left(\frac{1}{15} \times 0.26\right)^2$$

$$B = 2 \cdot \left(\frac{5}{15} \cdot \frac{9}{15}\right) (0.1 \times 0.05 \times 0.155) + 2 \cdot \left(\frac{5}{15} \cdot \frac{1}{15}\right) (0.05 \times 0.05 \times 0.26) + 2 \cdot \left(\frac{9}{15} \cdot \frac{1}{15}\right) (0.7 \times 0.155 \times 0.26)$$

So the volatility for contract #1 = $\sqrt{0.0092+0.0026} = 0.109$ or 10.9%.

A4.5) Tables

A) Liability Modeling Assumptions & Product Characteristics used for GC Factors.

Asset Based Charges (MER)	Vary by fund class. See section A4.5)B).
Base Margin Offset	100 basis points per annum.
GMDB Description	<ol style="list-style-type: none"> 1. ROP = return of premium ROP. 2. ROLL3 = 3% roll-up, capped at 2.5 × premium, frozen at age 80. 3. ROLL5 = 5% roll-up, capped at 2.5 × premium, frozen at age 80. 4. MAV = annual ratchet (maximum anniversary value), frozen at age 80. 5. HIGH = Higher of 5% roll-up and annual ratchet. 6. EDB = 40% Enhanced Death Benefit (capped at 40% of deposit). Note that the Pre-Calculated Factors were originally calculated with a combined ROP benefit, but they have been adjusted to remove the effect of the ROP. Thus, the factors for this benefit 5 are solely for the Enhanced Death Benefit.
Adjustment to GMDB Upon Partial Withdrawal	Separate factors for “Pro-Rata by Market Value” and “Dollar-for-Dollar.”
Surrender Charges	Ignored (i.e., zero). Included in the CA component.
Single Premium / Deposit	\$100,000. No future deposits; no intra-contract fund rebalancing.
Base Contract Lapse Rate (Total Surrenders)	<ul style="list-style-type: none"> • Pro-rata by MV: 10% p.a. at all contract durations (before dynamics) • Dollar-for-dollar: 2% p.a. at all contract durations (no dynamics)
Partial Withdrawals	<ul style="list-style-type: none"> • Pro-rata by MV: None (i.e., zero) • Dollar-for-dollar: Flat 8% p.a. at all contract durations (as a % of AV). No dynamics or anti-selective behavior.
Mortality	100% of the 1994 Variable Annuity MGDB Mortality Table (MGDB 94 ALB). For reference, 1000 × q _x rates at ages 65 and 70 for 100% of MGDB 94 ALB Male are 18.191 and 29.363 respectively. Note that section A4.3)I) allows modification to this assumption.
Gender /Age Distribution	100% male. Methodology accommodates different attained ages. A 5-year age setback will be used for female annuitants.
Max. Annuitization Age	All policies terminate at age 95.
Fixed Expenses	Ignored (i.e., zero). Included in the FE component.

Annual Fee and Waiver	Ignored (i.e., zero). Included in the <i>FE</i> component.
Discount Rate	5.75% pre-tax.
Dynamic Lapse Multiplier (Applies only to policies where GMDB is adjusted “pro-rata by MV” upon withdrawal)	$\lambda = \text{MIN} \left[U, \text{MAX} \left[L, 1 - M \times \left(\frac{GV}{AV} - D \right) \right] \right]$ <p>$U=1, L=0.5, M=1.25, D=1.1$</p> <ul style="list-style-type: none"> ▪ Applied to the ‘Base Contract Lapse Rate’ ▪ Does not apply to partial withdrawals.

APPENDIX 5 - Scenario Calibration Criteria

A5.1) General

This Appendix outlines the requirements for the stochastic models used to simulate fund performance.²⁴ Specifically, it sets certain standards that must be satisfied and offers guidance to the actuary in the development and validation of the scenario models. Background material and analysis are presented to support the recommendation. The Appendix focuses on the S&P 500 as a proxy for returns on a broadly diversified U.S. equity fund, but there is also advice on how the techniques and requirements would apply to other types of funds. General modeling considerations such as the number of scenarios and projection frequency are also discussed.

The calibration points given in this Appendix are applicable to gross returns (before the deduction of any fees or charges). To determine the net returns appropriate for the projections required by the Guideline, the actuary shall reflect applicable fees and contractholder charges in the development of projected account values. The projections shall also include the costs of managing the investments and converting the assets into cash when necessary.

As a general rule, funds with higher expected returns should have higher expected volatilities and in the absence of well-documented mitigating factors (e.g., a highly reliable and favorable correlation to other fund returns), should lead to higher reserve requirements.²⁵

State or path dependent models are not prohibited, but must be justified by the historic data and meet the calibration criteria. To the degree that the model uses mean-reversion or path-dependent dynamics, this must be well supported by research and clearly documented in the Memorandum supporting the required actuarial certification.

The equity scenarios used to determine reserves must be available in an electronic format to facilitate any regulatory review.

A5.2) Gross Wealth Ratios

Gross Wealth Ratios derived from the stochastic return scenarios for use with a Separate Account variable fund category for diversified U.S. equities must satisfy calibration criteria consistent with that for the S&P 500 shown in the following table. Under these calibration criteria, Gross Wealth Ratios for quantiles less than 50 percent may not exceed the value from the table corresponding to the quantile, while at quantiles greater than 50 percent; Gross Wealth Ratios may not be less than the corresponding value for the quantile from the table. Gross Wealth Ratios must be tested for holding period 1, 5, 10 and 20 years throughout the projections, except as noted in section A5.3).

The “wealth factors” are defined as gross accumulated values (i.e., before the deduction of fees and charges) with complete reinvestment of income and maturities, starting with a unit investment. These can be less than 1, with “1” meaning a zero return over the holding period.

S&P 500 Total Return Gross Wealth Ratios at the Calibration Points

²⁴ For more details on the development of these requirements, including the development of the calibration points, see the American Academy of Actuaries recommendation on C-3 Phase II risk-based capital.

²⁵ While the model need not strictly adhere to ‘mean-variance efficiency,’ prudence dictates some form of consistent risk/return relationship between the proxy investment funds. In general, it would be inappropriate to assume consistently ‘superior’ expected returns (i.e., risk/return point above the frontier).

Calibration Point	One Year	Five Year	Ten Year	Twenty Year
2.5%	0.78	0.72	0.79	
5.0%	0.84	0.81	0.94	1.51
10.0%	0.90	0.94	1.16	2.10
90.0%	1.28	2.17	3.63	9.02
95.0%	1.35	2.45	4.36	11.70
97.5%	1.42	2.72	5.12	

The scenarios need not strictly satisfy all calibration points, but the actuary should be satisfied that any differences do not materially reduce the resulting reserves.²⁶ In particular, the actuary should be mindful of which tail most affects the business being valued. If reserves are less dependent on the right (left) tail for all products under consideration (e.g., a return of premium guarantee would primarily depend on the left tail, an enhanced death benefit equal to a percentage of the gain would be most sensitive to the right tail, etc.), it is not necessary to meet the right (left) calibration points.

For models that require starting values for certain state variables,²⁷ long-term (‘average’ or ‘neutral’) values should be used for calibration. The same values should normally be used to initialize the models for generating the actual projection scenarios unless an alternative assumption can be clearly justified.²⁸ It should be noted that a different set of initialization parameters might produce scenarios that do not satisfy all the calibration points shown in the above table. However, the S&P 500 scenarios used to determine reserves must meet the calibration criteria.

A5.3) Calibration Requirements Beyond Twenty Years

It is possible to parameterize some path and/or state dependent models to produce higher volatility (and/or lower expected returns) in the first 20 years in order to meet the calibration criteria, but with lower volatility (and/or higher expected returns) for other periods during the forecast horizon. While this property may occur for certain scenarios (e.g., the state variables would evolve over the course of the projection and thereby affect future returns), it would be inappropriate and unacceptable for a company to alter the model parameters and/or its characteristics for periods beyond year 20 in a fashion not contemplated at the start of the projection and primarily for the purpose(s) of reducing the volatility and/or severity of ultimate returns.²⁹

A5.4) Other Funds

Calibration of other markets (funds) is left to the judgment of the actuary, but the scenarios so generated must be consistent with the calibration points in the table in section A5.2). This does not imply a strict functional relationship between the model parameters for various markets/funds, but it would generally be inappropriate to assume that a market or fund consistently “outperforms” (lower risk, higher expected return relative to the efficient frontier) over the long term.

²⁶ See the Preamble to the *Accounting Practices and Procedures Manual* for an explanation of materiality.

²⁷ For example, a stochastic log volatility (“SLV”) model requires the starting volatility. Also, the regime-switching lognormal model requires an assumption about the starting regime.

²⁸ A clear justification exists when state variables are observable or “known” to a high degree of certainty and not merely estimated or inferred based on a “balance of probabilities.”

²⁹ Such adjustments must be clearly documented and justified by the historic data.

The actuary shall document the actual 1-, 5-, 10- and 20-year wealth factors of the scenarios at the same frequencies as in the “S&P 500 Total Return Gross Wealth Ratios at the Calibration Points” table in section A5.2). The annualized mean and standard deviation of the wealth factors for the 1-, 5-, 10- and 20-year holding periods must also be provided. For equity funds, the actuary shall explain the reasonableness of any significant differences from the S&P500 calibration points.

When parameters are fit to historic data without consideration of the economic setting in which the historic data emerged, the market price of risk may not be consistent with a reasonable long-term model of market equilibrium. One possibility for establishing ‘consistent’ parameters (or scenarios) across all funds would be to assume that the market price of risk is constant (or nearly constant) and governed by some functional (e.g., linear) relationship. That is, higher expected returns can only be garnered by assuming greater risk.³⁰

Specifically, two return distributions X and Y would satisfy the following relationship:

$$\text{Market Price of Risk} = \left(\frac{E[R_X] - r}{\sigma_X} \right) = \left(\frac{E[R_Y] - r}{\sigma_Y} \right)$$

where $E[R]$ and σ are respectively the (unconditional) expected returns and volatilities and r is the expected risk-free rate over a suitably long holding period commensurate with the projection horizon. One approach to establish consistent scenarios would set the model parameters to maintain a near-constant market price of risk.

A closely related method would assume some form of ‘mean-variance’ efficiency to establish consistent model parameters. Using the historic data, the mean-variance (alternatively, ‘drift-volatility’) frontier could be constructed from a plot of (mean, variance) pairs from a collection of world market indices. The frontier could be assumed to follow some functional form,³¹ with the coefficients determined by standard curve fitting or regression techniques. Recognizing the uncertainty in the data, a ‘corridor’ could be established for the frontier. Model parameters would then be adjusted to move the proxy market (fund) inside the corridor.

Clearly, there are many other techniques that could be used to establishing consistency between the scenarios. While appealing, the above approaches do have drawbacks³² and the actuary should not be overly optimistic in constructing the model parameters or the scenarios.

Funds can be grouped and projected as a single fund if such grouping is not anticipated to materially reduce reserves. However, care should be taken to avoid exaggerating the benefits of diversification. The actuary must document the development of the investment return scenarios and be able to justify the mapping of the company’s variable accounts to the proxy funds used in the modeling.

³⁰ As an example, the standard deviation of log returns is often used as a measure of risk.

³¹ Quadratic polynomials and logarithmic functions tend to work well.

³² For example, mean-variance measures ignore the asymmetric and fat-tailed profile of most equity market returns.

A5.5) Correlation of Fund Returns

In constructing the scenarios for the proxy funds, the company may require parameter estimates for a number of different market indices. When more than one index is projected, it is generally necessary to allow for correlations in the simulations. It is not necessary to assume that all markets are perfectly positively correlated, but an assumption of independence (zero correlation) between the equity markets would inappropriately exaggerate the benefits of diversification. An examination of the historic data suggests that correlations are not stationary and that they tend to increase during times of high volatility or negative returns. As such, the actuary should take care not to underestimate the correlations in those scenarios used for the reserve calculations.

If the projections include the simulation of interest rates (other than for discounting surplus strain) as well as equity returns, the processes may be independent provided that the actuary can demonstrate that this assumption (i.e., zero correlation) does not materially underestimate the resulting reserves.

A5.6) Number of Scenarios and Efficiency in Estimation

For straight Monte Carlo simulation (with equally probable “paths” of fund returns), the number of scenarios should typically equal or exceed 1000. The appropriate number will depend on how the scenarios will be used and the materiality of the results. The actuary should use a number of scenarios that will provide an acceptable level of precision.

Fewer than 1000 scenarios may be used provided that the actuary has determined through prior testing (perhaps on a subset of the portfolio) that the CTE values so obtained materially reproduce the results from running a larger scenario set.

Variance reduction and other sampling techniques are intended to improve the accuracy of an estimate more efficiently than simply increasing the number of simulations. Such methods can be used provided the actuary can demonstrate that they do not lead to a material understatement of results. Many of the techniques are specifically designed for estimating means, not tail measures, and could in fact reduce accuracy (and efficiency) relative to straight Monte Carlo simulation.³³

The above requirements and warnings are not meant to preclude or discourage the use of valid and appropriate sampling methods, such as Quasi Random Monte Carlo (QRMC), importance sampling or other techniques designed to improve the efficiency of the simulations (relative to pseudo-random Monte Carlo methods). However, the actuary should maintain documentation that adequately describes any such techniques used in the projections. Specifically, the documentation should include the reasons why such methods can be expected not to result in systematic or material under-statement of the resulting reserves compared to using pseudo-random Monte Carlo numbers.

A5.7) Frequency of Projection and Time Horizon

Use of an annual cashflow frequency (“timestep”) is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the actuary should determine that the use of a more frequent (i.e., shorter) time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

³³ However, with careful implementation, many variance reduction techniques can work well for CTE estimators. For example, see Manistre, B.J. and Hancock, G. (2003), “Variance of the CTE Estimator,” 2003 Stochastic Modeling Symposium, Toronto, ON, September 2003.

Care must be taken in simulating fee income and expenses when using an annual time step. For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.³⁴

A5.8) Pre-Packaged Scenarios

The American Academy of Actuaries has provided 10,000 scenarios on its website³⁵ for the following nineteen asset classes.³⁶

- 1) 3-month U.S. Treasury yields
- 2) 6-month U.S. Treasury yields
- 3) 1-year U.S. Treasury yields
- 4) 2-year U.S. Treasury yields
- 5) 3-year U.S. Treasury yields
- 6) 5-year U.S. Treasury yields
- 7) 7-year U.S. Treasury yields
- 8) 10-year U.S. Treasury yields
- 9) 20-year U.S. Treasury yields
- 10) 30-year U.S. Treasury yields
- 11) Money Market / Short-Term
- 12) U.S. Intermediate Term Government Bonds
- 13) U.S. Long Term Corporate Bonds
- 14) Diversified Fixed Income
- 15) Diversified Balanced Allocation
- 16) Diversified Large Capitalized U.S. Equity

³⁴ As a general guide, the forecast horizon should not be less than 20 years.

³⁵ The pre-packaged scenarios can be found at <http://www.actuary.org/life/phase2.asp> and are fully documented at http://www.actuary.org/pdf/life/c3supp_march05.pdf.

³⁶ Because the reserves calculated using projections involve cash flow projections, the pre-packaged scenarios were developed under the “real world” probability measure (as opposed to a “risk-neutral” basis). Therefore, the pre-packaged scenarios may not be appropriate for purposes of projecting the market value of future hedge instruments within a projection (to the extent such instruments are used in the projections). For this purpose, it may be more appropriate to use risk neutral scenarios to determine the market value of hedge instruments in the cash flow projections that are based on real world scenarios.

- 17) Diversified International Equity
- 18) Intermediate Risk Equity
- 19) Aggressive or Specialized Equity

The scenarios are available as gross monthly accumulation factors (or U.S. Treasury yields) over a 30-year horizon in comma-separated value format (*.csv). These scenarios have been appropriately correlated so that the K^{th} scenario for each asset class must be used together and considered one ‘future investment return scenario.’³⁷ Hence, the scenarios can be combined (by blending the accumulation factors³⁸) to create additional ‘proxy’ scenarios for the company’s funds.

For example, suppose the actuary wanted to construct scenarios for a ‘balanced fund’ that targets a 60/40 allocation between bonds and U.S. equities. If we denote $[AF^X]$ as the matrix of accumulation factors for asset class X, then the balanced scenarios would be defined by $[AF^{BAL}] = 0.60 \times [AF^{BOND}] + 0.40 \times [AF^{S\&P500}]$. Care should be taken to avoid exaggerating the benefits of diversification. The actuary shall document the development of the investment return scenarios and be able to justify the mapping of the company’s variable accounts to the proxy funds used in the modeling.

The U.S. Treasury yields are expressed as nominal semi-annual bond equivalent yields in decimal format. All other returns are expressed as periodic (not cumulative) market accumulation factors (i.e., monthly “gross wealth ratios”). Interest rates are assumed to change at the start of each month, hence the value in column T applies for month T-1. The market accumulation factor in column T represents the growth in month T-1.

If all or a portion of these scenarios are used, then the actuary shall verify that the scenario calibration criteria are met.

³⁷ It is inappropriate to misalign the ordering of scenarios (e.g., scenario J for “Diversified U.S. Equity” cannot be combined with scenario K for “Diversified International Equity,” where $J \neq K$).

³⁸ It is important to blend the accumulation factors (not the returns) in order to achieve the desired asset mix.

APPENDIX 6 - Allocation of the Aggregate Reserves to the Contract Level

Section IV states that the Aggregate Reserve shall be allocated to the contracts falling within the scope of the Guideline. When the Conditional Tail Expectation Amount is greater than the Standard Scenario Amount, this allocation requires that the excess be allocated to the contracts falling within the scope of the Guideline.

A6.1) Allocation when the Aggregate Reserve equals the Conditional Tail Expectation Amount

- A) Single sub-grouping. When the Aggregate Reserve is equal to the Conditional Tail Expectation Amount and the Conditional Tail Expectation Amount is determined in aggregate for all contracts falling within the scope of the Guideline (i.e., a single grouping), as described in Section IV)D), the excess of the Conditional Tail Expectation Amount over the Standard Scenario Amount shall be allocated to each contract on the basis of the difference between the Standard Scenario Reserve and the Cash Surrender Value³⁹ on the valuation date for the contract. If the cash surrender value is not defined or not available, the Standard Scenario Amount will be the basis of allocation.
- B) Multiple sub-groupings. When the Aggregate Reserve is equal to the Conditional Tail Expectation Amount and the Conditional Tail Expectation Amount is determined using more than one sub-grouping, as described in Section IV)D), the allocation of the excess of the Conditional Tail Expectation Amount over the Standard Scenario Amount shall reflect that sub-grouping of contracts used to determine the Conditional Tail Expectation Amount, as described in Section IV)D).

For example, when the Conditional Tail Expectation Amount is determined using sub-grouping, the excess of the aggregate (i.e., the total for all contracts within the scope of the Guideline) Conditional Tail Expectation Amount over the aggregate Standard Scenario Amount shall be allocated only to those contracts that are part of sub-groupings whose contributions to the Conditional Tail Expectation Amount exceed their contribution to the Standard Scenario Amount.

In the case of such sub-groupings, the excess of the aggregate Conditional Tail Expectation Amount over the aggregate Standard Scenario Amount shall be allocated to each sub-grouping in proportion to the difference between the Conditional Tail Expectation and the Standard Scenario Reserve for each sub-grouping for which that excess is positive.

Once the allocation to each sub-grouping is determined, the excess of the reserve allocated to such sub-grouping over the Standard Scenario Amount determined for that sub-grouping shall be allocated to each contract within that sub-grouping on the basis of the difference between the Standard Scenario Reserve and the Cash Surrender Value on the valuation date for the contracts. If the cash surrender value is not defined or not available, the Standard Scenario Amount will be the basis of allocation.

³⁹ Note that since the Standard Scenario Reserve for a contract is, by definition, greater than or equal to the Cash Surrender Value, it is understood that the difference between the Standard Scenario Reserve and the Cash Surrender Value for each contract will never be less than zero.

As an example, consider a company with the results of the following three sub-groupings:

Sub-grouping	A	B	C	Total
Conditional Tail Expectation Amount	28	40	52	120
Standard Scenario Amount	20	45	30	95
Aggregate Reserve				120
(1) – (2)	8	-5	22	25
Allocation	6.67	0	18.33	25

In this example, the excess of the Conditional Tail Expectation Amount over the Standard Scenario Amount, in aggregate, equals 25 (i.e., the “Total” column of row 1 less row 2, or 120 – 95). This excess of 25 would be allocated only to those contracts that are part of sub-groupings whose contributions to the Conditional Tail Expectation Amount exceed their contributions to the Standard Scenario Amount. In this example, that would be contracts in sub-groupings A and C (since in sub-grouping B, the contribution to the Standard Scenario Amount exceeds the contribution to the Conditional Tail Expectation Amount). Therefore, the excess of 25 would be allocated to the contracts in sub-groupings A and C in proportion to the difference between the Conditional Tail Expectation Amount and the Standard Scenario Reserve for those sub-groupings (i.e. row 4). In this example, the total difference between the Conditional Tail Expectation Amount and the Standard Scenario Reserve for the contracts in sub-groupings A and C equals 8 + 22, or 30. This would result in 8/30 of the excess of the Conditional Tail Expectation Amount over the Standard Scenario Amount (or 6.67) to be allocated to the contracts in sub-groupings A and 22/30 of the excess of the Conditional Tail Expectation Amount over the Standard Scenario Amount (or 18.33) to be allocated to the contracts in sub-groupings C as shown on line (5) above.

In this example, the allocation of the Aggregate Reserve to contracts within sub-grouping B would equal the Standard Scenario Reserve for those contracts (as described in section A6.2) below). For sub-groupings A and C, the difference between the allocation of the Aggregate Reserve to each of those sub-grouping and the Standard Scenario Amount determined for each of those sub-grouping would be allocated to each contract within each of those sub-groupings based on the difference between the Standard Scenario Reserve and the Cash Surrender Value for each of the contracts within the relevant sub-group. The result would be an allocated Aggregate Reserve for a given contract that would be equal to the Standard Scenario Reserve for that contract plus the amount of the difference between 1) and 2) below that is allocated to that contract, where:

- 1) Equals the allocation of the Aggregate Reserve to that contract’s sub-grouping; and
- 2) Equals the Standard Scenario Amount determined for that contract’s sub-grouping.

A6.2) Allocation when the Aggregate Reserve equals the Standard Scenario Amount

The Standard Scenario Amount, as required by Section IV)C), is calculated on a contract-by-contract basis, as described in Appendix 3. Therefore, when the Aggregate Reserve is equal to the Standard Scenario Amount, the reserve allocated to each contract shall be the reserve calculated for each contract under the Standard Scenario method.

APPENDIX 7 – Modeling of Hedges

A7.1) Initial Considerations

The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of the Guideline (excluding those that involve the offsetting of the risks associated with variable annuity guarantees with other products outside of the scope of the Guideline, such as equity-indexed annuities) shall be included in the calculation of the Conditional Tail Expectation Amount, determined in accordance with Section IV)D) and section A1.4) of the Guideline (i.e., Conditional Tail Expectation Amount using projections). If the company is following a Clearly Defined Hedging Strategy (“hedging strategy”), as defined in Section III, in accordance with an investment policy adopted by the Board of Directors, or a committee of Board members, the company is eligible to reduce the amount of the Conditional Tail Expectation Amount using projections otherwise calculated. The investment policy must clearly articulate the company’s hedging objectives, including the metrics that drive rebalancing/trading. This specification could include maximum tolerable values for investment losses, earnings, volatility, exposure, etc. in either absolute or relative terms over one or more investment horizons vis-à-vis the chance of occurrence. Company management is responsible for developing, documenting, executing and evaluating the investment strategy, including the hedging strategy, used to implement the investment policy.

For this purpose, the investment assets refer to all the assets including derivatives supporting covered products and guarantees. This is also referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which is also referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this Appendix. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this Appendix, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.

This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

The cost and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of the Guideline shall be included in the stochastic cash flow model used to calculate the Conditional Tail Expectation Amount in accordance with Section IV)D) (the “model”). If the company is following a Clearly Defined Hedging Strategy, the model shall take into account the cost and benefits of hedge positions expected to be held by the company in the future based on the operation of the hedging strategy.

Before either a new or revised hedging strategy can be used to reduce the amount of the Conditional Tail Expectation Amount otherwise calculated, the hedging strategy should be in place (i.e., effectively implemented by the company) for at least three months. The company may meet the time requirement by having evaluated the effective implementation of the hedging strategy for at least three months without actually having executed the trades indicated by the hedging strategy (e.g., mock testing or by having effectively implemented the strategy with similar annuity products for at least three months).

These requirements do not supersede any statutes, laws, or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

A7.2) Background

The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two methods as described below. Although a hedging strategy would normally be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the Conditional Tail Expectation Amount otherwise calculated.

The fundamental characteristic of the first method is that all hedging positions, both the currently held positions and those expected to be held in the future, are included in the stochastic cash flow model used to determine the Scenario Greatest Present Value, as discussed in Section IV)D), for each scenario.

The fundamental characteristic of the second method is that the effectiveness of the current hedging strategy (including currently held hedge positions) on future cash flows is evaluated, in part or in whole, outside of the stochastic cash flow model. In this case, the reduction to the Conditional Tail Expectation Amount otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.

Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions), on the Conditional Tail Expectation Amount needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation, and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the Conditional Tail Expectation Amount attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company's ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transforms some risks into others, introduces new risks or has other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the "Greeks" other than delta. Another example is that financial indices underlying typical hedging instruments typically do not perform exactly like the separate account funds, and hence the use of hedging instruments has the potential for introducing basis risk.

A7.3) Calculation of CTE Amount (reported)

The company should begin by calculating "CTE Amount (best efforts)" – the results obtained when the Conditional Tail Expectation Amount (or "CTE Amount") is based on incorporating the hedging strategy (including currently held hedge positions) into the stochastic cash flow model, including all of the factors and assumptions needed to execute the hedging strategy (e.g., stochastic implied volatility).

Because most models will include at least some approximations or idealistic assumptions, CTE Amount (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the company shall recalculate the Conditional Tail Expectation Amount assuming the company has no dynamic hedging strategy (i.e., reflect only hedge positions held by the company on the valuation date. The result so obtained is called "CTE Amount (adjusted)." In some situations the determination of CTE Amount (adjusted) may include both direct and indirect techniques.

Finally, the reported value for the Conditional Tail Expectation Amount is given by:

$$\text{CTE Amount (reported)} = E \times \text{CTE Amount (best efforts)} + (1 - E) \times \text{CTE Amount (adjusted)}$$

The value for E (an “effectiveness factor”) reflects the actuary’s view as to the level of sophistication of the stochastic cash flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the “Greeks” being covered by the strategy) as well as the associated costs, risks, and benefits E will be no greater than 0.70. As the sophistication of the stochastic cash flow model increases, the value for E increases (i.e., the greater the ability of the CTE Amount (best efforts) model to capture all risks and uncertainties, the higher the value of E). If the model used to determine the “CTE Amount (best efforts)” effectively reflects all of the parameters used in the hedging strategy, the value of E may be up to 0.70. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, E must be in the lower end of the range. If hedge cash flows are not modeled directly, E will be no greater than 0.30. Simplistic hedge cash flow models will have a value of E in the low range between 0.00 and 0.70.

Additionally, the company shall demonstrate that, based on an analysis of at least the most recent 12 months, the model is able to replicate the hedging strategy in a way that justifies the value used for E. A company that does not have 12 months of experience to date shall set E to a value no greater than 0.30.

A7.4) Specific Considerations and Requirements

As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the Conditional Tail Expectation Amount, the actuary should review actual historical hedging effectiveness. The actuary shall evaluate the appropriateness of the assumptions on future trading, transaction costs, and other elements of the model, the strategy, the mix of business, and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either Anticipated Experience or adverse estimates of the parameters.

A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contractholder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the variable annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contractholder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the Conditional Tail Expectation Amount, the actuary must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

Implementing a strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.

The combination of elements of the stochastic cash flow model, including the initial actual market asset prices, prices for trading at future dates, transaction costs, and other assumptions should be analyzed by the actuary as to whether the stochastic cash flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:

- A) Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money; or
- B) Hedging strategies that with a given amount of initial money never make less than accumulation at the one-period risk free rates in any scenario but make more than this in one or more scenarios.

If the stochastic cash flow model allows for such situations, the actuary should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. In addition, the actuary should disclose the situations and provide supporting documentation as to why the actuary believes the situations are not material for determining the Conditional Tail Expectation Amount. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the Conditional Tail Expectation Amount otherwise calculated.

In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. If there are substantial discrepancies, the actuary should disclose the substantial discrepancies and provide supporting documentation as to why the model-based prices are appropriate for determining the Conditional Tail Expectation Amount. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

A7.5) Certification and Documentation

The actuary must provide a certification that the values for E, CTE Amount (adjusted) and CTE Amount (best efforts) were calculated using the process discussed above and the assumptions used in the calculations were reasonable for the purpose of determining the Conditional Tail Expectation Amount. The actuary shall document the method(s) and assumptions (including data) used to determine CTE Amount (adjusted) and CTE Amount (best efforts) and maintain adequate documentation as to the methods, procedures and assumptions used to determine the value of E.

The actuary must provide a certification as to whether the Clearly Defined Hedging Strategy is fully incorporated into the stochastic cash flow model and any supplementary analysis of the impact of the hedging strategy on the Conditional Tail Expectation Amount. The actuary must document the extent to which elements of the hedging strategy (e.g., time between portfolio rebalancing) are not fully incorporated into the stochastic cash flow model and any supplementary analysis to determine the impact, if any. In addition, the actuary must provide a certification and maintain documentation to support the certification that the hedging strategy designated as the Clearly Defined Hedging Strategy meets the requirements of a Clearly Defined Hedging Strategy including that the implementation of the hedging strategy in the stochastic cash flow model and any supplementary analysis does not include knowledge of

events that occur after any action dictated by the hedging strategy (i.e. the model cannot use information about the future that would not be known in actual practice).

A financial officer of the company (e.g., Chief Financial Officer, Treasurer or Chief Investment Officer) or a person designated by them who has direct or indirect supervisory authority over the actual trading of assets and derivatives must certify that the hedging strategy meets the definition of a Clearly Defined Hedging Strategy and that the Clearly Defined Hedging Strategy is the hedging strategy being used by the company in its actual day to day risk mitigation efforts.

Not for Distribution

APPENDIX 8 – Certification Requirements**A8.1) Management Certification**

Management must provide signed and dated written representations as part of the valuation documentation that the valuation appropriately reflects management's intent and ability to carry out specific courses of actions on behalf of the entity where such is relevant to the valuation. This certification will be submitted no later than March 1. Upon written request by the company, the commissioner may grant an extension of the date for submission of the certification.

A8.2) Actuarial Certification

- A) General Description. The certification shall be provided by a qualified actuary and consist of at least the following:
- 1) A paragraph identifying the actuary and his or her qualifications;
 - 2) A scope paragraph identifying the reserves as of the valuation date for contracts included in the certification categorized by the approaches used to determine the reserves (e.g., Alternative Methodology, Projections, Standard Scenario);
 - 3) A reliance paragraph describing those areas, if any, where the certifying actuary has relied on other experts;
 - a) A reliance statement from each of those relied on should accompany the certification.
 - b) The reliance statements should note the information being provided and a statement as to the accuracy, completeness or reasonableness, as applicable, of the information.
 - 4) A paragraph certifying that the reserve was calculated in accordance with the principles and requirements of the Guideline;
 - 5) A paragraph certifying that the assumptions used for these calculations are Prudent Estimate assumptions for the products, scenarios, and purpose being tested; and
 - 6) A paragraph stating that the qualified actuary is not opining on the adequacy of the company's surplus or its future financial condition.
 - 7) This certification will be submitted no later than March 1. Upon written request by the company, the commissioner may grant an extension of the date for submission of the certification.

A8.3) Supporting Memorandum

- A) General Description. A supporting memorandum shall be created to document the methodology and assumptions used to determine the Aggregate Reserve. The information shall include the comparison of the Standard Scenario Amount to the Conditional Tail Expectation Amount required by Section IV)A) in the determination of the Aggregate Reserve.
- B) Alternative Methodology using Published Factors.
- 1) If a seriatim approach was not used, disclose how contracts were grouped.

- 2) Disclosure of assumptions to include:
 - a) Component CA
 - (i) Mapping to prescribed asset categories
 - (ii) Lapse and withdrawal rates
 - b) Component FE
 - (i) Determination of fixed dollar costs and revenues
 - (ii) Lapse and withdrawal rates
 - (iii) Inflation rates
 - c) Component GC
 - (i) Disclosure of contract features and how the company mapped the contract form to those forms covered by the Alternative Methodology factors
 - Product Definition - If not conservatively assigned to a published factor, company specific factors or stochastic modeling is required.
 - Partial Withdrawal Provision
 - Fund Class - Disclose the process used to determine the single asset class that best represents the exposure for a contract. If individual funds are mapped into prescribed categories, the process used to map the individual funds should be disclosed.
 - Attained Age
 - Contract Duration
 - Ratio of Account Value to Guaranteed Value
 - Annualized Account Charge Differential from Base Assumption
 - (ii) Derivation of Equivalent Account Charges
 - (iii) Derivation of margin offset
 - (iv) Disclosure of interpolation procedures and confirmation of node determination
 - 3) Disclosure, if applicable, of reinsurance that exists and how it was handled in applying published factors (For some reinsurance, creation of company-specific factors or stochastic modeling may be required.).
 - a) Discuss how reserves before reinsurance were determined.
- C) Alternative Factors based on Company-Specific Factors.
- 1) Disclosure of requirements consistent with Published Factors, as noted in subsection B) above.
 - 2) Stochastic analysis supporting adjustments to published factors should be fully documented. This analysis needs to be submitted when initially used and be available upon request in subsequent years. Adjustments may include:
 - a) Contract design;
 - b) Risk mitigation strategy (excluding hedging); and
 - c) Reinsurance.
- D) Stochastic Modeling.
- 1) Assets
 - a) Description including type and quality
 - b) Investment & disinvestment assumptions

- c) Describe assets used at the start of the projection
 - d) Source of asset data
 - e) Asset valuation basis
 - f) Documentation of assumptions
 - (i) Default costs
 - (ii) Prepayment functions
 - (iii) Market value determination
 - (iv) Yield on assets acquired
 - (v) Mapping and grouping of funds to modeled asset classes
 - g) Hedging Strategy
 - (i) Documentation of strategy
 - (ii) Identification of current positions
 - (iii) Description on how strategy was incorporated into modeling
 - Basis risk, gap risk, price risk, assumption risk
 - Document the methods and criterion used to estimate the a priori effectiveness of the hedging strategy
 - (iv) Documentation required for specific consideration raised in section A7.4).
 - (v) Documentation and certification required by section A7.5).
- 2) Liabilities
- a) Product descriptions
 - b) Source of Liabilities
 - c) Grouping of contracts
 - d) Reserve method and modeling (e.g., Working Reserves were set to CSV)
 - e) Investment Reserves
 - f) Describe how reinsurance was handled in the models, including how reserves gross of reinsurance were modeled.
 - g) Documentation of assumptions (i.e., list assumptions, discuss the sources and the rationale for using the assumptions).
 - (i) Premiums and subsequent deposits
 - (ii) Withdrawal, Lapse and Termination Rates
 - Partial Withdrawal (including treatment of dollar-for-dollar offsets on GMDBs and VAGLBs, and Required Minimum Distributions
 - Lapses / Surrenders
 - (iii) Crediting Strategy
 - (iv) Mortality
 - (v) Annuitization rates
 - (vi) Income Purchase rates
 - (vii) GMIB and GMWB Utilization rates
 - (viii) Commissions
 - (ix) Expenses
 - (x) Persistency Bonuses
 - (xi) Investment / Fund Choice
 - (xii) Revenue Sharing
 - (xiii) Asset Allocation, Rebalancing and Transfer Assumptions
 - Dollar Cost Averaging
 - h) The section showing the assumptions used for lapse and utilization assumptions for contracts with guaranteed living benefits in the development of the Conditional Tail Expectation Amount, as described in section A9.7).

- 3) Scenarios
 - a) Description of scenario generation for interest rates and equity returns
 - (i) Disclose the number “n” of scenarios used and the methods used to determine the sampling error of the CTE (70) statistic when using “n” scenarios.
 - (ii) Time step of model (e.g., monthly, quarterly, annual)
 - (iii) Correlation of fund returns
 - b) Calibration
 - (i) Gross Wealth Ratios for equity funds
 - Disclosure of adjustments to model parameters, if any.
 - Disclosure of 1-year, 5-year and 10-year wealth factors, as well as mean and standard deviation.
 - (ii) Consistency of other funds to equity funds
 - (iii) Correlation between all funds
 - (iv) Estimate of market return volatility assumptions underlying the generated scenarios compared to actual observed volatility underlying market values.
 - c) Extent of use of pre-packaged scenarios and support for mapping variable accounts to proxy funds
 - 4) Description and results of sensitivity tests performed. At the request of the domiciliary commissioner, the company shall provide a sensitivity test showing an estimate of the impact of the market return volatility assumption when market volatility is materially higher than assumed in the generated scenarios.
 - 5) Documentation of all material changes in the model or assumptions from that used previously and the estimated impact of such changes. This documentation, or a summary of this documentation, shall be included in an executive summary or some other prominent place in the memorandum.
 - 6) A description of the methods used to validate the model and a summary of the results of the validation testing.
- E) Standard Scenario.
- 1) For the amounts in 2), 3) and 4) below report the Basic Reserve in A3.3)B)2)a), the projection requirements in A3.3)B)2)b), the value of Aggregate reinsurance in A3.3)D)1), the value of hedges in A3.3)D)2), the total allocation of the value of hedges and Aggregate reinsurance in A3.3)B)2)c) and the Standard Scenario Reserve.
 - 2) Report the Standard Scenario Amount as of the valuation date.
 - 3) If applicable, report the Standard Scenario Amount on the inforce prior to the valuation date that was used to project the reserve requirements to the valuation date.
 - 4) If applicable, report the Standard Scenario Amount on the model office used to represent the inforce.
 - 5) Discuss modifications, if any, in the application of the standard scenario requirements to produce the amounts in 2), 3) and 4) above.

- 6) Document any assumptions, judgments or procedures not prescribed in the Standard Scenario Method or in the Guideline that are used to produce the Standard Scenario Amount.
 - 7) If applicable, documentation of approval by the commissioner to use the Basic Reserve as the Standard Scenario Amount.
 - 8) Document the company's calculation of DR.
 - 9) Document the allocation of funds to Equity, Bond, Balanced and Fixed classes.
 - 10) A statement by the actuary that none of the reinsurance treaties included in the Standard Scenario serve solely to reduce the calculated Standard Scenario Reserve without also reducing risk on scenarios similar to those used to determine the Conditional Tail Expectation Reserve. This should be accompanied by a description of any reinsurance treaties that have been excluded from the Standard Scenario along with an explanation of why the treaty was excluded.
- F) The memorandum shall be made available for examination by the commissioner upon his or her request but shall be returned to the company after such examination and shall not be considered a record of the insurance department or subject to automatic filing with the commissioner.

Not for Distribution

APPENDIX 9 – Contractholder Behavior

A9.1) General

Contractholder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contractholder behavior is difficult to predict and behavior assumptions can significantly impact the results. In the absence of relevant and fully credible empirical data, the actuary should set behavior assumptions on the conservative end of the plausible spectrum (consistent with the definition of Prudent Estimate).

In setting behavior assumptions, the actuary should examine, but not be limited by, the following considerations:

- 1) Behavior can vary by product, market, distribution channel, fund performance, time/product duration, etc.
- 2) Options embedded in the product may impact behavior.
- 3) Options may be elective or non-elective in nature. Living benefits are often elective and death benefit options are generally non-elective.
- 4) Elective contractholder options may be more driven by economic conditions than non-elective options.
- 5) As the value of a product option increases, there is an increased likelihood that contractholders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
- 6) Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contractholders may not always act in their best financial interest). The rational component should be dynamic but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contractholder behavior based on increased or decreased financial efficiency in exercising their contractual options.
- 7) Options that are ancillary to the primary product features may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things such as:
 - a) For what purpose was the product purchased?
 - b) Is the option elective or non-elective?
 - c) Is the value of the option well known?
- 8) External influences, including emergence of viatical / life settlement companies, may impact behavior.

A9.2) Aggregate vs. Individual Margins

As noted in Section III)B)8), Prudent Estimate assumptions are developed by applying a margin for uncertainty to the Anticipated Experience assumption. The issue of whether the level of the margin applied to the Anticipated Experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section II) of this Guideline, which states:

The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the Conditional Tail Expectation Amount at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the Conditional Tail Expectation Amount, the actuary should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Although this Principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.

Therefore, the actuary shall determine Prudent Estimate assumptions independently for each behavior (e.g., mortality lapses, and benefit utilization), using the requirements and guidance in this Appendix and throughout the guideline, unless the actuary can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more behaviors.

A9.3) Sensitivity Testing

The impact of behavior can vary by product, time period, etc. Sensitivity testing of assumptions is required and shall be more complex than e.g., base lapse assumption minus 1% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually utilizing the guarantee. The actuary should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the actuary shall use higher margins when the underlying experience is less than fully relevant and credible.

A9.4) Specific Considerations and Requirements

Within materiality considerations, the actuary should consider all relevant forms of contractholder behavior and persistency, including but not limited to the following:

- 1) Mortality (additional guidance and requirements regarding mortality is contained in Appendix 10)
- 2) Surrenders
- 3) Partial Withdrawals (Systematic and Elective)
- 4) Fund Transfers (Switching/Exchanges)
- 5) Resets/Ratchets of the Guaranteed Amounts (Automatic and Elective)
- 6) Future Deposits

It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions. For example:

- 1) The impact of fund transfers (intra-contract fund “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing, dollar cost averaging accounts, etc.)
- 2) Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).

However, the actuary should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contractholder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):

- 1) Gender
- 2) Attained age
- 3) Issue age
- 4) Contract duration
- 5) Time to maturity
- 6) Tax status
- 7) Fund value
- 8) Investment option
- 9) Guaranteed benefit amounts
- 10) Surrender charges, transaction fees or other contract charges
- 11) Distribution channel

Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contractholder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contractholders’ efficiency will increase over time.

In determining contractholder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that are similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not

identical business segment. The actuary shall document any significant similarities or differences between the two business segments, the data quality of the similar business segment and the adjustments and the margins applied.

Where relevant and fully credible empirical data do not exist for a given contractholder behavior assumption, the actuary shall set the contractholder behavior assumption to reflect the increased uncertainty such that the contractholder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the Aggregate Reserve. If there are no relevant data, the actuary shall set the contractholder behavior assumption to reflect the increased uncertainty such that the contractholder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of Prudent Estimate, with the Principles described in Section I, and with the guidance and requirements in this Appendix.

Ideally, contractholder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contractholder behavior should neither assume that all contractholders act with 100% efficiency in a financially rational manner nor assume that contractholders will always act irrationally.

A9.5) Dynamic Assumptions

Consistent with the concept of Prudent Estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors which are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contractholder.

The actuary should exercise care in using static assumptions when it would be more natural and reasonable to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality, the use of dynamic models is encouraged, but not mandatory. Risk factors which are not scenario tested, but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers) may require higher margins and/or signal a need for higher margins for certain other assumptions.

Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The actuary shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

A9.6) Consistency with the CTE Level

All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the approximately top 1/3 of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the actuary should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use Prudent Estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For variable annuities, these “valuation” scenarios would typically display one or more of the following attributes:

- 1) Declining and/or volatile separate account asset values;
- 2) Market index volatility, price gaps and/or liquidity constraints;

- 3) Rapidly changing interest rates.

The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the actuary should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

- 1) Remain logically and internally consistent across the scenarios tested;
- 2) Represent plausible outcomes; and
- 3) Lead to appropriate, but not excessive, asset requirements.

The actuary should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.

Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contractholder behavior.

A9.7) Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business and is accompanied by documentation that clearly demonstrates the relevance of the experience, as discussed in the following paragraph.

The supporting memorandum required by Appendix 8 of this Guideline, shall include a separately identifiable section showing the assumptions used for lapse and utilization assumptions for contracts with guaranteed living benefits in the development of the Conditional Tail Expectation Amount. This section shall be considered part of the supporting memorandum and shall show the formulas used to set the assumptions and describe the key parameters affecting the level of the assumption (e.g., age, duration, in-the-moneyness, during and after the surrender charge period). The section shall include a summary that shows the lapse and utilization rates that result from various combinations of the key parameters. The section shall show any experience data used to develop the assumptions and describe the source, relevance and credibility of that data. If relevant and credible data were not available, the section should discuss how the assumption is consistent with the requirement that the assumption is to be on the conservative end of the plausible range of expected experience. The section shall also discuss the sensitivity tests performed to support the assumption. This separately identifiable section shall be made available on a standalone basis if requested by the Domiciliary Commissioner. If it is requested, the section shall have the same confidential status as the supporting memorandum and the actuarial memorandum supporting the actuarial opinion, as discussed in section A2.3)B).

Regarding lapse assumptions for contracts with guaranteed living benefits, the section shall include, at a minimum, the following:

- 1) Actual to expected lapses on two bases, where “expected” equals one of the following:
 - a) Prudent estimate assumptions used in the development of the Conditional Tail Expectation Amount;
 - b) The assumptions used in the Standard Scenario;
- 2) The lapse assumptions used in the development of Conditional Tail Expectation Amount and corresponding actual experience separated by:
 - a) Logical blocks of business (based on company’s assessment);
 - b) Duration (at a minimum this should show during the surrender charge period vs. after the surrender charge period);
 - c) In-the-moneyness (consistent with how dynamic assumptions are determined); and
 - d) Age (to the extent age impacts the election of benefits lapse).

This data shall be separated by experience incurred in the following periods:

- a) In the past year;
- b) In the past three years; and
- c) All years.

Not for Distribution

APPENDIX 10 – Specific Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A10.1) Overview

- A) Intent. The guidance and requirements in this Appendix apply for setting Prudent Estimate mortality assumptions when determining the Conditional Tail Expectation Amount (whether using projections or the Alternative Methodology). The intent is for Prudent Estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice (where more than one approach to appropriate actuarial practice exists, the actuary should select the practice that the actuary deems most appropriate under the circumstances) with only a limited role for unsupported actuarial judgment.
- B) Description. Prudent Estimate mortality assumptions are determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins are applied to the experience to reflect data uncertainty. The expected mortality curves are then adjusted based on the credibility of the experience used to determine the expected mortality curve. Section A10.2) addresses guidance and requirements for determining expected mortality curves and section A10.3) addresses guidance and requirements for adjusting the expected mortality curves to determine Prudent Estimate mortality.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in section A10.4).

- C) Business Segments. For purposes of setting Prudent Estimate mortality assumptions, the products falling under the scope of the Guideline shall be grouped into business segments with different mortality assumptions. The grouping should generally follow the pricing, marketing, management and/or reinsurance programs of the company. Where less refined segments are used for setting the mortality assumption than is used in business management the documentation should address the impact, if material, of the less refined segmentation on the resulting reserves.
- D) Margin for Data Uncertainty. The expected mortality curves that are determined in section A10.2) may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this Appendix, if mortality must be increased (decreased) to provide for uncertainty the business segment is referred to as a plus (minus) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a plus (minus) segment to a minus (plus) segment to the extent compliance with this subsection requires such a reclassification.

A10.2) Determination of Expected Mortality Curves

- A) Experience Data. In determining expected mortality curves the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See section B) below for

additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in subsection C) below.

- B) Data Other than Direct Experience. If expected mortality curves for a segment are being determined using data from a similar business segment (whether or not directly written by the company), the actuary shall document any similarities or differences between the two business segments (e.g., type of underwriting, marketing channel, average policy size, etc.). The actuary shall also document the data quality of the mortality experience of the similar business. Adjustments shall be applied to the data to reflect differences between the business segments and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment. The actuary shall document the adjustments and the margins applied.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk may also be a reasonable starting point for the determination of the company's expected mortality curves. The actuary shall document the application of such reinsurance charges and how they were used to set the company's expected mortality curves for the segment.

- C) No Data Requirements. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than using 100% of the 1994 Variable Annuity MGDB mortality table for a plus segment and expected deaths no greater than 100% of the Annuity 2000 table for a minus segment. If mortality experience on the business segment is expected to be atypical (e.g., demographics of target markets are known to have higher (lower) mortality than typical), these "no data" mortality requirements may not be adequate.
- D) Additional Considerations Involving Data. The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in subsection A) above or other than direct data discussed in subsection B) above).
- 1) Underreporting of deaths. Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.
 - 2) Experience by contract duration. Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the actuary shall assume that expected mortality will increase by contract duration for an appropriate select period. As an alternative, if the actuary determines that mortality is impacted by selection, the actuary could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.
 - 3) Modification and Relevance of data. Even for a large company the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., 3 to 7 years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments. If this condition is not satisfied,

the actuary must document the rationale in support of using expected mortality that differs from recent mortality experience.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented. There should be commentary in the documentation on the relevance of the data (e.g., any actual and expected changes in markets, products and economic conditions over the historic and projected experience).

- 4) Other considerations. In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

E) Documentation Requirements.

- 1) All Segments. The documentation should include any material considerations necessary to understand the development of mortality assumptions for the statutory valuation even if such considerations are not explicitly mentioned in this section. The documentation should be explicit when material judgments were required and such judgments had to be made without supporting historic experience.

The documentation shall:

- a) Explain the rationale for the grouping of contracts into different segments for the determination of mortality assumptions and characterize the type and quantity of business that constitute each segment.
- b) Describe how each segment was determined to be a plus or minus segment.
- c) Summarize any mortality studies used to support mortality assumptions, quantify the exposures and corresponding deaths, describe the important characteristics of the exposures and comment on unusual data points or trends.
- d) Document the age of the experience data used to determine expected mortality curves and comment on the relevance of the data.
- e) Document the mathematics used to adjust mortality based on credibility and summarize the result of applying credibility to the mortality segments.
- f) Discuss any assumptions made on mortality improvements, the support for such assumptions and how such assumptions adjusted the modeled mortality.
- g) Describe how the expected mortality curves compare to recent historic experience and comment on any differences.
- h) Discuss how the mortality assumptions are consistent with the goal of achieving the required CTE level over the joint distribution of all future outcomes, in keeping with Principle #3 and Appendix 9.

If the study was done on a similar business segment, identify the differences in the business segment on which the data were gathered and the business segment on which the data were used to determine mortality assumptions for the statutory valuation. Describe how these differences were reflected in the mortality used in modeling.

If mortality assumptions for the statutory valuation were based in part on reinsurance rates, document how the rates were used to set expected mortality (e.g., assumptions made on loadings in the rates and/or whether the assuming company provided their expected mortality and the rationale for their assumptions).

- 2) Plus Segments. For a plus segment, the documentation shall also discuss the examination of the mortality data for the underreporting of deaths and experience by duration, and describe any adjustments that were made as a result of the examination.
- 3) Minus Segments. For a minus segment the documentation shall also discuss how the mortality deviations on minus segments compare to those on any plus segments. To the extent the overall margin is reduced, the documentation should include support for this assumption.

A10.3) Adjustment for Credibility to Determine Prudent Estimate Mortality

- A) Adjustment for Credibility. The expected mortality curves determined in section A10.2) shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at Prudent Estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves with a mortality table consistent with a statutory valuation mortality table. For a plus segment, the table shall be consistent with 100% of the 1994 Variable Annuity MGDDB table (or a more recent mortality table adopted by the NAIC to replace this table). For a minus segment, the table shall be consistent with 100% of the 2000 Annuity table (or a more recent mortality table adopted by the NAIC to replace that table). The approach used to adjust the curves shall suitably account for credibility.⁴⁰
- B) Adjustment of Statutory Valuation Mortality for Improvement. For purposes of the adjustment for credibility, the statutory valuation mortality table for a plus segment may be and the statutory valuation mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect applicable published industrywide experience from the effective date of the respective statutory valuation mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves (discussed in section A10.2)).
- C) Credibility Procedure. The credibility procedure used shall:
 - 1) Produce results that are reasonable in the professional judgment of the actuary,
 - 2) Not tend to bias the results in any material way,
 - 3) Be practical to implement,
 - 4) Give consideration to the need to balance responsiveness and stability,
 - 5) Take into account not only the level of aggregate claims but the shape of the mortality curve, and
 - 6) Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.

Documentation of the credibility procedure used shall include a description of the procedure, the statistical basis for the specific elements of the credibility procedure, and any material changes from prior credibility procedures.

⁴⁰ For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the statutory valuation mortality table used in the blending.

- D) Further Adjustment of the Credibility-adjusted Table for Mortality Improvement. The credibility-adjusted table used for plus segments may be and the credibility adjusted date used for minus segments must be adjusted for applicable published industrywide experience from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in section A10.4).

A10.4) Future Mortality Improvement

The mortality assumption resulting from the requirements of section A10.3) shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting Conditional Tail Expectation Amount. If such an adjustment would reduce the Conditional Tail Expectation Amount, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve, reducing them otherwise).

Actuarial Guideline XLIII

CARVM FOR VARIABLE ANNUITIES

Table of Contents

Section I	Background
Section II	Scope
Section III	Reserve Requirements
Section IV	Effective Date and Transition

Section I) Background

This Actuarial Guideline (Guideline) interprets the standards for the valuation of reserves for variable annuity and other contracts involving certain guaranteed benefits similar to those offered with variable annuities. The Guideline codifies the basic interpretation of the Commissioners Annuity Reserve Valuation Method (CARVM) by clarifying the assumptions and methodologies that will comply with the intent of the Standard Valuation Law. It also applies similar assumptions and methodologies to contracts that contain characteristics similar to those described in the scope, but that are not directly subject to CARVM.

In developing the Guideline, two regulatory sources provided guidance. First, the Standard Valuation Law defines CARVM as the greatest present value of future guaranteed benefits. Second, the NAIC Model Variable Annuity Regulation (VAR) states that the “reserve liability for variable annuities shall be established pursuant to the requirements of the Standard Valuation Law in accordance with actuarial procedures that recognize the variable nature of the benefits provided and any mortality guarantees.”

During 2019 this Guideline was amended to follow the reserve requirements provided in VM-21 of the *Valuation Manual*. This was done for uniformity for all coverages within scope regardless of whether they were issued prior to or on and after the operative date of the *Valuation Manual*. This was also done to reflect the extensive analysis carried out by the NAIC, Oliver Wyman consulting for the NAIC, and industry participants for improvements to the variable annuity framework.

Section II) Scope

- A) The Guideline applies to contracts, and product features on contracts, issued on or after January 1, 1981, and prior to the date that the *Valuation Manual* becomes effective in the applicable jurisdiction, whether directly written or assumed through reinsurance, falling into any of the following categories:
- 1) Variable deferred annuity contracts subject to the Commissioner’s Annuity Reserve Valuation Method (CARVM), whether or not such contracts contain Guaranteed Minimum Death Benefits (GMDBs), or Variable Annuity Guaranteed Living Benefits (VAGLBs);
 - 2) Variable immediate annuity contracts, whether or not such contracts contain GMDBs or VAGLBs;
 - 3) Group annuity contracts that are not subject to CARVM, but contain guarantees similar in nature¹ to GMDBs, VAGLBs, or any combination thereof; and

¹ The term “similar in nature,” as used in sections II(A)3) and II(A)4) is intended to capture both current products and benefits as well as product and benefit designs that may emerge in the future. Examples of the currently known designs are listed in footnote 2. Any product or benefit design that does not clearly fit the Scope should be evaluated on a case-by-case basis taking into consideration factors that include, but are not limited to, the nature of the guarantees, the definitions of GMDB and VAGLB in

- 4) All other products that contain guarantees similar in nature to GMDBs or VAGLBs, even if the insurer does not offer the mutual funds or variable funds to which these guarantees relate, where there is no other explicit reserve requirement.²

If such a benefit is offered as part of a contract that has an explicit reserve requirement and that benefit does not currently have an explicit reserve requirement:

- a) The Guideline shall be applied to the benefit on a standalone basis (i.e., for purposes of the reserve calculation, the benefit shall be treated as a separate contract);
 - b) The reserve for the underlying contract is determined according to the explicit reserve requirement; and
 - c) The reserve held for the contract shall be the sum of a) and b).
- B) The company may elect to apply these requirements to contracts and product features on contracts, whether directly written or assumed through reinsurance, falling into any of the categories defined in Section II.A. and issued prior to January 1, 1981.
- C) The Guideline does not apply to contracts falling under the scope of the NAIC Model Modified Guaranteed Annuity Regulation (Model #255); however, it does apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in Modified Guaranteed Annuities (e.g., market value adjustments).
- D) Separate account annuity contracts that guarantee an index and do not offer GMDBs or VAGLBs are excluded from the scope of the Guideline.

Section III) Reserve Requirements

- A) Reserves shall be determined by following the requirements in VM-21 from the version of the NAIC *Valuation Manual* applicable for that valuation date. For purposes of determining reserves, at the election of the company, the contracts subject to this Guideline may be aggregated with the contracts subject to VM-21 of the *Valuation Manual*. Alternatively, the company may elect to not aggregate the contracts subject to this Guideline with those subject to VM-21 of the *Valuation Manual*, and value these as a separate group of contracts.
- B). The development of the reserves shall be documented following the requirements in VM-31 of the NAIC *Valuation Manual* applicable for that valuation date.

Section IV) Effective Date and Transition

- A) This Actuarial Guideline applies for valuations on or after January 1, 2020. The phase-in provisions of VM-21 also apply for the contracts and product features subject to the Guideline.

VM-01 and whether the contractual amounts paid in the absence of the guarantee are based on the investment performance of a market-value fund or market-value index (whether or not part of the company's separate account).

² For example, a group life contract that wraps a GMDB around a mutual fund would generally fall under the scope of the Guideline since there is not an explicit reserve requirement for this type of group life contract. However, for an individual variable life contract with a GMDB and a benefit similar in nature to a VAGLB, the Guideline would generally apply only to the VAGLB-type benefit, since there is an explicit reserve requirement that applies to the variable life contract and the GMDB.

- B) A company may elect to apply these requirements for the valuation on December 31, 2019, in lieu of the requirements of the prior version of this Guideline. If so elected, the reserves will be established by following the requirements of VM-21 from the 2020 NAIC *Valuation Manual* and the documentation requirements of VM-31 from the 2020 NAIC *Valuation Manual*.

Actuarial Guideline XLIV

GROUP TERM LIFE WAIVER OF PREMIUM DISABLED LIFE RESERVES

I. Background

Section 4.G. of the Standard Valuation Law establishes tables approved by the commissioner as the minimum standard for computing reserves for group life insurance and special benefits. The purpose of this Actuarial Guideline (Guideline) is to determine the minimum standard of valuation for group term life waiver of premium disabled life benefits and to recognize the 2005 Group Term Life Waiver (GTLW) Mortality and Recovery Tables.

Group term life policies do not maintain contract reserves beyond the duration of the policy issued to the group policyholder. However, some policies guarantee an extended death benefit to an individual insured who is disabled according to the terms of the policy. Thus, to the extent such guarantees are made, a disabled life reserve must be maintained for each individual that is so disabled. However, prior to the creation of this guideline, there has been no formal guidance regarding the calculation of these disabled life reserves.

II. Scope

This guideline applies to group term life certificates on individuals who become disabled on or after January 1, 2009. Based on the provisions of Section 4.G. of the Standard Valuation Law, companies may apply this to group term life certificates on individuals who became disabled prior to January 1, 2009, provided they obtain permission from the commissioner.

III. Definitions

“2005 GTLW Mortality Tables” means the mortality rate tables shown in Attachments A and B.

“2005 GTLW Recovery Tables” means the recovery rate tables shown in Attachments C and D.

IV. Text

A. Group Waiver of Premium Reserve Calculation

1. The minimum standard of valuation for group term life waiver of premium disabled life benefits shall be the present value of the death benefit payable discounted for interest and recovery. Since there is not a contract reserve based upon an aggregate table, the discounted value of waived premiums is inadequate to support this liability.
2. Except as provided in Section B, the 2005 GTLW Mortality and Recovery Tables shall be used for determining the minimum standard of valuation for any group term life waiver of premium disabled life benefit incurred on or after the effective date of this guideline. The valuation tables were derived from employer-employee group life experience. Other forms of group term life insurance are also subject to the same requirements if they contain similar extended death benefit provisions. Section B offers ways to modify the underlying rates of mortality or recovery if they differ from those associated with the underlying experience in the valuation table.
3. The maximum interest rate shall be the maximum rate permitted by law in the valuation of life insurance of the same guaranteed duration issued on the same

date as the claim incurral date of disability. This maximum interest rate shall be used for determining the minimum standard of valuation for any group term life waiver of premium disabled life benefit incurred on or after the effective date of this guideline. The guaranteed duration used to determine the life insurance rate of interest is equal to the largest term in years between the point at which any individual in the group may become disabled and the point at which no death benefit is available. Thus, if a person could become disabled at age 20, and remain disabled, and receive a benefit upon death before age 65, the guaranteed duration would be 45 years. For most groups and companies this would mean the maximum interest rate shall be the rate for life insurance with duration greater than 20 years.

B. Use of Company Experience

1. The Appointed Actuary shall review company experience at least once every five years. The review of company experience can range from a detailed experience study to a high level analysis. The extent of the review must be sufficient to enable the Appointed Actuary to defend any conclusion reached. Company experience shall:

- i. Be segmented into policies with similar benefits, on individuals of each gender;
- ii. Be experience-specific to the company;
- iii. Include all relevant experience in the past three most recent years;
- iv. Exclude experience that is not in the past six most recent years;
- v. Otherwise be relevant, in accordance with the professional judgment of the Appointed Actuary; and
- vi. Not be deemed irrelevant by the commissioner.

2. The commissioner may require a company to use its experience based upon the most recent review referenced in Section B.1 to establish its specific valuation tables if:

- i. Actual mortality experience is reasonably expected to be greater than 90% of the 2005 GTLW Mortality Tables; or
- ii. Actual recovery experience is reasonably expected to be less than 125% of the 2005 GTLW Recovery Tables.

Under these circumstances, the commissioner may require a company to use the process set out in Section B.4 and establish for the company a minimum value for Z.

3. A company may use its experience exclusively without reference to the standard tabular mortality expected experience or to the standard tabular recovery expected experience to create its specific valuation tables if:

- i. The Appointed Actuary can demonstrate and certify the following:

- a) The company-specific valuation tables are based on company experience with allowances for graduation and margins for adverse experience;
 - b) The company-specific mortality valuation tables used for computing minimum reserves for group term life waiver of premium benefits are such that there is at least an 85% statistical confidence that the actual annual aggregate mortality will be less than the mortality in the company-specific-mortality valuation tables; and
 - c) The company-specific recovery valuation tables used for computing minimum reserves for group term life waiver of premium benefits are such that there is at least an 85% statistical confidence that the actual annual aggregate recoveries will be greater than the recoveries in the company-specific recovery valuation tables.
- ii. The company has written permission from the domiciliary commissioner to use the company-specific valuation tables.
 - iii. Unless otherwise exempted or required, the specific valuation tables shall apply to the computation of minimum reserves for group term life waiver of premium disabled life benefits for claims incurred during or after the calendar year in which the study was performed.
 - iv. The company shall not use mortality and recovery tables with rates that produce reserves less than the reserves produced by using 75% of the 2005 GTLW Mortality Tables and 160% of the 2005 GTLW Recovery Tables for all durations of disability combined.
4. If not invoking Section B.3, a company may use a credibility-weighted combination of company mortality experience with the 2005 GTLW Mortality Tables and/or of company recovery experience with the 2005 GTLW Recovery Tables to create its specific valuation tables.
- i. The blended tables for each gender and type of experience (mortality and recovery) shall be computed using the formula $\text{Blended Table} = T \times S$, where:
 - a) Z shall be a credibility weighting factor, between 0 and 1, developed by the Appointed Actuary using credibility theory methods not unacceptable to the commissioner;
 - b) F shall be the ratio of the company's actual experience to the expected experience for the 2005 GTLW Mortality and Recovery Tables for each gender and type of experience (mortality and recovery);
 - c) M shall be 1.12 for mortality tables and 0.80 for recovery tables. The values provide a smooth transition between the 2005 tables and company experience when $Z = 1$;

- d) S shall be the 2005 GTLW Mortality and Recovery Tables; and
- e) T shall be computed using the following steps:

Step 1: Compute the raw value of $T = [Z \times (F \times M) + (1 - Z)]$.

Step 2: Round T to the nearest 5%.

Step 3: If the absolute difference between the T produced in step 2 and the value of T utilized immediately prior to the study is less than 10%, then set T equal to the value of T utilized immediately prior to the study.

Step 4: For all durations of disability, combined for each gender, set the value of T to the greater of 75% and the T resulting from step 3 for mortality and set the value of T to the lesser of 160% and the T resulting from step 3 for recovery.

- ii. The company has written permission from the domiciliary commissioner to use the blended valuation tables.
- iii. Unless otherwise exempted or required, the specific valuation tables shall apply to the computation of minimum reserves for group term life waiver of premium disabled life benefits for claims incurred during or after the calendar year in which the study was performed.

Actuarial Guideline XLV

THE APPLICATION OF THE STANDARD NONFORFEITURE LAW FOR LIFE INSURANCE TO CERTAIN POLICIES HAVING INTERMEDIATE CASH BENEFITS

Scope

This Guideline applies to individual life insurance policies, other than variable and non-variable adjustable life policies and current assumption whole life policies, that provide for an endowment benefit, materially less than the policy face amount, at a specified intermediate duration during a longer period of life insurance protection. The payment of such endowment benefit does not alter or eliminate any premiums or benefits scheduled for the period subsequent to the endowment date, nor does the policy automatically terminate upon payment of the endowment benefit. Policies that offer a return of premium endowment benefit may be considered a special case of the policies subject to this Guideline.

Background

In recent years a new category of life insurance products has emerged in the life insurance marketplace. These products offer a cash benefit at a specified time, typically many years prior to the coverage expiry date of the policy, conditioned on the insured being alive and the policy being in force at that time. The cash benefit has often taken the form of an intermediate period endowment that is either built into the policy or is provided through a rider or an endorsement. When the amount of the cash benefit is based upon the premiums paid into the policy, the benefit is often referred to as a return of premium benefit.

The straightforward application of Sections 3 and 5c of the Standard Nonforfeiture Law For Life Insurance (the Law), considering guaranteed benefits and premiums (whether guaranteed or indeterminate) during the entire period death benefits are guaranteed available under the policy, subject only to the payment of required premiums, can result in negative or very low cash values at all durations for these products. This is caused by high premiums assumed applicable in the later durations. This application of the Law produces unacceptable results, as it fails to recognize that the cash benefit should be prefunded with the premiums that fall due prior to the time the benefit becomes available.

The intent of this Guideline is to provide guidance with respect to the required minimum cash values for some of the products described in the Scope section. However, other products within the scope designed to provide similar benefits, and having similar premium structures (for example products having a cash value at the end of an initial level premium period equal to the total premiums paid) would be expected to provide minimum cash values that are determined in a manner consistent with this Guideline. For products with multiple endowment benefits, the minimum cash values should be determined in accordance with the principles of this Guideline.

Text

- A. The following methodology shall be used in the determination of minimum cash surrender values for policies subject to this Guideline in accordance with the requirements of the Law.
 1. The endowment period shall be that period of time measured from the issue date of the policy to the date when the endowment benefit becomes payable (the endowment date) under the terms of the policy.
 2. If the endowment benefit is added by rider to a policy, then for minimum cash value determination purposes the base policy and the endowment benefit are to be treated as integrated.

3. Premiums under the policy may be provided through a scale of guaranteed rates for the term of the policy or through a scale of current rates that are subject to a scale of guaranteed maximum premiums; if rates are subject to a scale of guaranteed maximum premiums, the minimum cash values shall be the greater of those produced under this Guideline using the guaranteed maximum rates and current rate scale applicable at issue of the policy.
4. Any cash surrender value available under the policy in the event of default in a premium payment due on any policy anniversary during the endowment period shall be an amount not less than the excess, if any, of the present value, on the anniversary, of the endowment benefit and any future incremental death benefits during the endowment period which would have been provided for by the policy if there had been no default, over the sum of:
 - (i) The then present value of the adjusted premiums as defined below corresponding to premiums which would have fallen due on and after the anniversary during the endowment period; and
 - (ii) The amount of any indebtedness to the company on the policy.
5. Incremental death benefits are death benefits during the endowment period in excess of the lowest death benefit provided under the policy during the endowment period.
6. The adjusted premiums for the policy shall be calculated on an annual basis and shall be such uniform percentage of the respective premiums specified in the policy for each policy year during the endowment period, excluding amounts payable as extra premiums to cover impairments or special hazards and also excluding any uniform annual contract charge or policy fee specified in the policy in a statement of the method to be used in calculating the cash surrender value and paid-up nonforfeiture benefits, that the present value, at the date of issue of the policy, of all adjusted premiums shall be equal to the sum of:
 - (i) The present value of the endowment benefit and any incremental death benefits provided for by the policy during the endowment period;
 - (ii) One percent (1%) of the average amount of insurance (total death benefit under the policy, including any incremental death benefits) at the beginning of each of the first ten policy years; and
 - (iii) One hundred twenty-five percent (125%) of the nonforfeiture net level premium as defined below, provided however, that no nonforfeiture net level premium shall be considered to exceed 4% of the average amount of insurance (total death benefit under the policy, including any incremental death benefits) at the beginning of each of the first ten policy years.
7. The nonforfeiture net level premium for the policy shall be equal to the present value, at the date of issue of the policy, of the endowment benefit and any incremental death benefits provided for by the policy during the endowment period, divided by the present value, at the date of issue of the policy, of an annuity of one per annum payable on the date of issue of the policy and on each anniversary of such policy on which a premium falls due prior to the endowment date.

8. The mortality rates and interest rate used in the determination of the minimum cash values for the policy shall be those applicable under the Law considering during the entire period death benefits are guaranteed available under the policy, subject only to the payment of required premiums.
- B. In no event can the cash surrender value under the policy at any duration be less than the greater of:
1. The minimum cash value calculated according to Section A of this Guideline; and
 2. The minimum cash value at the same duration resulting from the application of the methods described in Sections 3 and 5c of the Law considering guaranteed benefits and premiums (whether guaranteed or indeterminate) during the entire period death benefits are guaranteed available under the policy, subject only to the payment of required premiums. In performing this calculation, no annual premium at any duration after the endowment period shall exceed the difference between the death benefit and the cash value at that duration.
- C. The cash surrender values for the policy must also satisfy the consistency of progression of cash values test contained in Section 8 of the Law, considering guaranteed benefits and premiums (whether guaranteed or indeterminate) during the entire period death benefits are guaranteed available under the policy, subject only to the payment of required premiums.
- D. For policies where the benefit is defined in more general terms as providing for a return of premiums paid or a portion of premiums paid, the procedures of Subsection 5c C of the Law and the requirements of Section A above shall be applied in the determination of a revised set of minimum cash values in the event the value of the endowment benefit of the policy changes due to a change made to the premium schedule provided at issue.

Applicability

This Guideline is effective for all policy forms filed on or after January 1, 2009, and affects all contracts issued on or after January 1, 2010.

Actuarial Guideline XLVI

INTERPRETATION OF THE CALCULATION OF THE SEGMENT LENGTH WITH RESPECT TO THE LIFE INSURANCE POLICIES MODEL REGULATION UPON A CHANGE IN THE VALUATION MORTALITY RATES SUBSEQUENT TO ISSUE

I. Background

Some states have revised their regulation permitting the use of the 2001 CSO Preferred Class Structure Mortality Table so that at the company's option it might be used to value a policy on a plan which was previously approved for issue based on valuation using the 2001 CSO Mortality Table. A company making this election would be changing the valuation mortality rates. It is also the case that use of the 2001 CSO Preferred Class Structure Mortality Table is predicated upon the block of policies initially, and annually thereafter, satisfying certain requirements with respect to the present value of death benefits over certain future periods. If these requirements are not satisfied at some point in the future, the company must change to a table for which the requirements are satisfied. For example, this could mean changing from the super preferred nonsmoker table to the preferred nonsmoker table or maybe from the preferred smoker table to the smoker table. Although a non-elective change, this is also a change in the valuation mortality rates.

Section 4B of the Valuation of Life Insurance Policies Model Regulation defines the "Contract Segmentation Method" in which segments are to be calculated using the valuation mortality rates for deficiency reserves. Thus, potentially either of the two examples given above could trigger a recalculation of the valuation segments at the time the valuation mortality rates are changed. The purpose of this guideline is to prescribe which circumstances involving a change to the valuation mortality rates, require a recalculation of the segments and which do not.

The Valuation of Life Insurance Policies Model Regulation was adopted, in part, to stop the use of high net premiums late in the policy's life from unduly influencing the level of reserves early in the policy's life ("postfunding"). The contract segmentation method was the answer devised to control this. After the adoption of this regulation, companies incorporated the establishment of the segment lengths into the policy design process based on the valuation mortality expected to be used. Now it is seen that there are circumstances in which it may be necessary or desirable to change valuation mortality after issue. But if it triggers a segment recalculation then there could be unintended, undesirable results.

This guideline classifies the circumstances involved in changes to valuation mortality rates into two categories: those where deliberately designed postfunding is less likely so no segment recalculation is prescribed, and those where such postfunding is more possible so segment recalculation is required. In general, non-elective valuation mortality changes require no segment recalculation, while elective valuation mortality changes are divided into those on plans filed for approval before the adoption of this guideline and those filed after adoption. To preclude enhancing postfunding by changing valuation mortality after a plan is approved, recalculation of segments is required if the change is elected on plans filed after adoption of this guideline, but is not required for plans filed before.

II. Scope

This guideline is effective December 31, 2008.

III. Text

A. For policies subject to a non-elective change in valuation mortality rates:

For policies which were the subject of a non-elective change in valuation mortality rates because the requirements for continued use of the prior rates were no longer satisfied, Section 4B of the Valuation of Life Insurance Policies Model Regulation shall be interpreted so that the segments need not be recalculated.

B. For policies subject to a company election to substitute the 2001 Preferred Class Structure Table for the 2001 CSO Mortality Table:

1. For policies issued on a policy form filed for approval prior to January 1, 2009, Section 4B of the Valuation of Life Insurance Policies Model Regulation shall be interpreted so that the segments need not be recalculated.

2. For policies issued on a policy form filed for approval after January 1, 2009, Section 4B of the Valuation of Life Insurance Policies Model Regulation shall be interpreted to require that the segments be recalculated using the new valuation mortality rates.

Not for Distribution

Actuarial Guideline XLVII

THE APPLICATION OF COMPANY EXPERIENCE IN THE CALCULATION OF CLAIM RESERVES UNDER THE 2012 GROUP LONG-TERM DISABILITY VALUATION TABLE

I. Background

The 2012 Group Long-Term Disability (GLTD) Valuation Table, as included in the *Health Insurance Reserves Model Regulation* (#10), is the valuation standard to replace the Commissioner's Group Disability Table 1987 (CGDT87 Table) with a new one based on the GLTD 2008 Table. This table is referred to as the GLTD 2012 Valuation Table and can be found at the following location:

http://www.naic.org/documents/01_naic_2012_group_long-term_disability_valuation_table.xls

An actuarial guideline is more appropriate to handle the multiple segments of the 2012 GLTD Valuation Table, the computations of own experience and the application of credibility which are not normally found in model regulations.

II. Purpose

The purpose of this Actuarial Guideline is to provide an instruction for the use of the 2012 GLTD Valuation Table that is referenced in the *Health Insurance Reserves Model Regulation* (#10). This guideline pertains to Group Long-Term Disability claims consistent with the conditions defined in the model regulation, and governs the selection of claim termination rates for the purpose of calculating GLTD claim reserves. This guideline does not address reserve adequacy, which remains the concern of the insurer according to the terms expressed in the model regulation.

Although the various detailed formulas in this guideline do not directly address or define reserve adequacy, it is assumed that appropriate adequacy tests will be made periodically. Such adequacy testing is considered to be an additional tool for the actuary to make appropriate choices where leeway from any prescription made herein is allowed (A/E calculation, margin, etc.) so that the calculation of the reserve will generally be adequate and the actuary does not need to continually rely on other measures to achieve adequacy. In addition to the few times that leeway from prescription is mentioned below, nothing in this guideline should be assumed to prohibit the actuary from building a case and requesting permission from the state insurance commissioner for other appropriate variations. Many such situations, because they would apply to fully credible blocks of business and are intended for continual use, should be considered for approval by the commissioner for a period tied to the updates required by Section C.vi and not approved on an annual basis.

III. Text

A. When the insurer follows the instructions provided in this guideline, the selected claim termination rates automatically meet the minimum valuation standard defined in the model regulation.

B. Valuation Table Modifications

If not invoking the small company exception specified in Section D, a company must use a credibility-weighted combination of its own claim termination experience with the 2012 GLTD Valuation Table to create its specific valuation table.

i. For claims in Duration Group 1 (duration \leq 3 months), termination rates may be developed as below consistent with other Duration Groups or in any other

manner deemed appropriate by the actuary. With respect to credibility, any value between 0 and 1.0 that the actuary deems appropriate for the block may be used.

- ii. For claims beyond 3 months, the valuation termination rates shall be computed using the termination rates from the 2012 GLTD Valuation Table (S) multiplied by experience adjustment factors (T) that are calculated separately for four different duration groups.

$$\text{Valuation Termination Rate} = T \times S$$

The duration groups are defined as follows:

Group 2: duration > 3 months and duration \leq 24 months

Group 3: duration > 24 months and duration \leq 60 months

Group 4: duration > 60 months and duration \leq 120 months

Group 5: duration > 120 months

- a) S shall be the sum of recovery and death rates from the 2012 GLTD Valuation Table.
- b) T shall be computed as $T = [Z \times F * (1 - M) + (1 - Z)]$.
- 1) Z shall be a credibility weighting factor, between 0 and 1, developed for each duration group according to the following specifications:
Groups 2-5: $Z = \text{Min} \left(\sqrt{N/K}, 1 \right)$ N is the number of expected recovery and death counts from the 2012 GLTD Valuation Table.
- 2) K is a set of constants defined by duration group as follows:
Group 2: $K = 3,300$ Group 4: $K = 2,100$
Group 3: $K = 2,500$ Group 5: $K = 1,700$
- 3) F shall be the ratio of the company's actual total of recovery and death counts to the expected recovery and death counts for the 2012 GLTD Valuation Table for each duration group specified above.

If the actuary has reserve adequacy or other significant analysis that demonstrates in the development and use of Company Specific Experience (see Section C below) that an alternative measurement is deemed appropriate, such as:

- I. Use of some other weighting of claims (gross benefit, net benefit, etc.) that is not only appropriate for measuring A/E, but also is expected to generally produce reserves not less than those produced by using a claim count measurement.
- II. Use of an increased credibility factor Z if F is less than 1 to give the company experience more weight.

Then, a basis other than claim count may be used.

- 4) M is the company experience margin, determined for each duration group according to the following formula:

$$M = \text{Min} \left(15\%, \text{Max} \left(5\%, 3\% + 1.65 * \sqrt{A/C} \right) \right)$$

This is the minimum value for the definition of M prior to any reserve adequacy analysis. Adequacy tests and analysis of experience (sharpness of fluctuations, trends over the period of the termination rate study, changing claims practices, etc.) may indicate that a larger value of M may be more appropriate. If so, such a value is deemed appropriate.

- 5) A is a set of constants defined by duration group as follows:

Group 2: $A = 4.0$

Group 4: $A = 2.5$

Group 3: $A = 3.0$

Group 5: $A = 2.0$

- 6) C shall be the company's actual number of total recovery and death counts by duration group.

- iii. The company shall not use termination rates that produce total reserves for claims disabled for more than two years that are less than the reserves produced for these claims by computing T as $\underline{T} = 1.30$. If the Company Specific Experience, determined in Section C below, for Duration Group 3 includes at least 5,000 claim terminations, the value of T for that Duration Group shall not be limited to ≤ 1.30

C. Company Specific Experience—Own Experience Measurement

In computing values F and S to comply with Section B above, the appointed actuary shall:

- i. Segment the company claim termination experience into any major subgroups that may produce significantly different results (e.g., market niches, claims operations, unique benefit designs, etc.).
- ii. Combine affiliated statutory entities and assumed reinsurance, where claim management is under a common structure, when considering company experience. It is also appropriate to evaluate experience separately when specific blocks of company business have distinct claim management practices or significantly different risk characteristics.
- iii. Include all relevant experience the company is capable of providing for as many of the last five years as possible (not including the lag period described below). However, there are two situations where using other than a five-year period may be more appropriate. The first is when a company's experience in a longer period not only increases credibility but is still relevant and appropriate for the company's products and claim management practices. The second is for a company that has had significant changes in product and/or claim management practices within the past five years that has diminished the relevance of the company's experience early in the five-year period. In this second situation, less than five years of experience may be used for any duration band for which there is compelling logic and when either the company's experience to be used is at

least 90% credible, or the shorter experience period produces higher reserves than using five years.

- iv. Recognize a suitable lag period to allow for a full resolution of claim status. The lag period used in the 2008 GLTD Study was 12 months. However, the appointed actuary may use a different lag period based on his or her company experience. For example, company experience indicates that all changes after the selected lag period are negligible.
- v. Measure actual (A) to expected (E) terminations based on claim count (unless another weighting is deemed more appropriate, as mentioned in Section B(ii)(b)4), where the E is based on monthly expected recoveries and deaths from the 2012 GLTD Valuation Table. Claim count is also used in the measurement of credibility.
- vi. Update the minimum valuation basis in accordance with Section B above at least once every five years. In addition, the valuation basis also must be updated whenever the company's annual own experience study produces, in accordance with Section B, a value T that changes by more than 10% from the one used in the current valuation basis for any of the five duration groups.
- vii. Recognize where appropriate any flexibility built into the 2012 GLTD Valuation Table, such as not utilizing diagnosis-specific termination rates when the information is deemed unreliable.
- viii. Do not count as terminations those claims that are closed due to settlement (i.e., a lump sum replacing a series of potential future payments), or that have reached the end of the maximum benefit duration, or that are closed due to a contractual limit, such as a mental and nervous limit. For this purpose, a closure due to a change in definition of disability should be considered an actual termination and not a termination due to reaching the maximum benefit duration.
- ix. Use experience that is otherwise relevant in accordance with the professional judgment of the appointed actuary.
- x. Do not use experience that the commissioner has deemed inappropriate or likely to produce significantly inadequate reserves.

In the above paragraphs, the expression term "company" refers to a single company or a group of legally related companies subject to the same claim management.

D. Own Experience Measurement Exemption

If, at the time of valuation, a company has fewer than 50 open claims disabled within two years of the effective date of the valuation, and fewer than 200 open claims disabled more than two years prior to the effective date of the valuation, the carrier is exempt from the requirement that the 2012 GLTD Valuation Table be modified by the company's own experience. Open claims include only claims subject to valuation using the 2012 GLTD Valuation Table. Said company will use 100% of the 2012 Valuation Table for calculating claims termination rates in order to comply with the minimum valuation standard.

Actuarial Guideline XLVIII
(Applies to 2017 and Subsequent Year Valuations)

**ACTUARIAL OPINION AND MEMORANDUM REQUIREMENTS FOR THE REINSURANCE
OF POLICIES REQUIRED TO BE VALUED UNDER SECTIONS 6 AND 7 OF THE NAIC
VALUATION OF LIFE INSURANCE POLICIES MODEL REGULATION (MODEL #830)**

Background

The NAIC Principle-Based Reserving Implementation (EX) Task Force (“PBRI Task Force”) serves as the coordinating body for all NAIC technical groups involved with projects related to the Principle-Based Reserves (PBR) initiative for life and health policies. The PBRI Task Force was also charged with further assessing, and making recommendations regarding, the solvency implications of life insurance reserve financing mechanisms addressed in the June 6, 2013 NAIC White Paper of the Captives and Special Purpose Vehicle Use (E) Subgroup of the Financial Condition (E) Committee. Some of these reinsurance arrangements have been referred to as “XXX/AXXX Captive arrangements,” although not all such arrangements actually involve reinsurers organized as captives. In this connotation, XXX denotes the reserves prescribed by Section 6 of the NAIC *Valuation of Life Insurance Policies Model Regulation* (Model #830) while AXXX denotes the reserves prescribed by Section 7 of Model #830, and by *Actuarial Guideline XXXVIII—The Application of the Valuation of Life Insurance Policies Model Regulation* (AG 38). On June 30, 2014, the PBRI Task Force adopted a framework as found in Exhibits 1 and 2 of the June 4, 2014 report from Rector & Associates, Inc. (the “June 2014 Rector Report”). Exhibit 2 of the report included a charge to the Life Actuarial (A) Task Force (LATF) to develop a level of reserves (the “Required Level of Primary Security”) that must be supported by certain defined assets (“Primary Security”). The level of reserves is to be calculated by a method referred to as the “Actuarial Method.” Another charge to LATF was to promulgate an actuarial guideline specifying that, in order to comply with the NAIC *Actuarial Opinion and Memorandum Regulation*, Model 822 (“AOMR”) as it relates to XXX/AXXX reinsurance arrangements, the opining actuary must issue a qualified opinion as to the ceding insurer’s reserves if the ceding insurer or any insurer in its holding company system has engaged in a XXX/AXXX reserve financing arrangement that does not adhere to the Actuarial Method and Primary Security forms adopted by the NAIC. The initial version of *Actuarial Guideline XLVIII—Actuarial Opinion and Memorandum Requirements for the Reinsurance of Policies Required to be Valued under Sections 6 and 7 of the NAIC Valuation of Life Insurance Policies Model Regulation* (AG 48) was developed in response to that charge, with an effective date of January 1, 2015.

Coordination between this Actuarial Guideline and the NAIC Term and Universal Life Insurance Reserve Financing Model Regulation (Model #787)

Subsequently, on January 8, 2016, the NAIC adopted revisions to the *Credit for Reinsurance Model Law* (Model #785). Among other things, the revisions to Model #785 provide commissioners with the authority to enact, by regulation, additional requirements for ceding insurers to claim credit for reinsurance with respect to certain XXX/AXXX financing arrangements. On December 13, 2016, the NAIC adopted the *Term and Universal Life Insurance Reserve Financing Model Regulation* (Model #787) as the regulation permitted by Model #785. LATF subsequently received a charge to redraft AG 48 to make it as consistent as possible with the provisions of Model #787. The current version of this actuarial guideline is the result.

The following is an overview of the interrelationship between this actuarial guideline and Model #787, and the regulatory strategy that led to the adoption of each:

1. The initial version of this actuarial guideline immediately established national standards for the use of XXX/AXXX financing arrangements in an attempt to quickly set minimum standards based on the framework adopted by the PBRI Task Force on June 30, 2014. This initial version applied to such reinsurance arrangements entered into on or after 1/1/2015.

2. The revised statute (the NAIC *Credit for Reinsurance Model Law* (Model #785)) and a new regulation (the NAIC *Term and Universal Life Insurance Reserve Financing Model Regulation* (Model #787)) were then developed and adopted by the NAIC.
3. Except as noted in #4 below, this actuarial guideline will cease to be effective, on a state by state basis, as individual states enact Model #785 and adopt Model #787 to replace it.
4. Notwithstanding, it is anticipated that in a small number of states, Model #787 will need to be adopted on a “prospective” basis only (that is, it will only apply to ceded policies issued on or after the effective date thereof). In those cases, this actuarial guideline will remain as the authority for ceded policies subject to this actuarial guideline but to which Model #787, as adopted in a given state, does not apply. So although its role might diminish, this actuarial guideline will remain an essential part of the regulatory framework for a small number of states for many years to come.
5. To ensure uniformity of treatment between states, companies, and ceded policies (whether governed by this actuarial guideline or by Model #787) and to avoid confusion, this actuarial guideline is being updated, effective as of January 1, 2017, to make it as substantively identical to Model #787 as possible.

Authority, Avoidance, and Purpose

The requirements in this actuarial guideline derive authority from Section 3 of the AOMR, or, after the Operative Date of the *Valuation Manual*, from Section 1 of VM-30 of the *Valuation Manual*. Both Section 3 of the AOMR and Section 1 of VM-30 provide that the commissioner has the authority to specify specific methods of actuarial analysis and actuarial assumptions when, in the commissioner's judgment, these specifications are necessary for an acceptable opinion to be rendered relative to the adequacy of reserves and related items. As contained in the framework adopted by the PBRI Task Force on June 30, 2014, this actuarial guideline defines new terms, such as Primary Security and Required Level of Primary Security, specifies the Actuarial Method used to calculate the Required Level of Primary Security, and specifies other requirements that must be followed when reinsurance is involved in order for the appointed actuary to render an actuarial opinion that is not qualified.

No statute, regulation or guideline can anticipate every potential XXX/AXXX captive arrangement. Common sense and professional responsibility are needed to assure not only that the text of this actuarial guideline is strictly observed, but also that its purpose and intent are honored scrupulously. To that end, and to provide documentation to the appointed actuary as to the arrangements that are subject to review under this actuarial guideline, the appointed actuary may request from each ceding insurer, and may rely upon, the certification by the Chief Financial Officer or other responsible officer of each ceding insurer filed with the insurer's domiciliary regulator that the insurer has not engaged in any arrangement or series of arrangements involving XXX or AXXX reserves that are designed to exploit a perceived ambiguity in, or to violate the purpose and intent of, this actuarial guideline.

The purpose and intent of this actuarial guideline is to establish uniform, national standards governing XXX or AXXX reserve financing arrangements¹ in conformity with the PBRI Task Force framework and, in connection with such arrangements, to ensure that Primary Security, in an amount at least equal to the Required Level of Primary Security, is held by or on behalf of the ceding insurer. As described further in Section 4.B., the provisions of this actuarial guideline are not intended to apply to policies that were issued prior to 1/1/2015 if those policies were included in a captive reserve financing arrangement as of 12/31/2014. Further, the requirements of this actuarial guideline should be viewed as minimum standards and are not a substitute for the diligent analysis of reserve financing arrangements by regulators. A regulator should impose requirements in addition to those set out in this actuarial guideline if the facts and circumstances warrant such action.

Text

1. Authority

Pursuant to Section 3 of the AOMR or, after the Operative Date of the *Valuation Manual*, to Section 1 of VM-30 of the *Valuation Manual*, the commissioner shall have the authority to specify specific methods of actuarial analysis and actuarial assumptions when, in the commissioner's judgment, these specifications are necessary for an acceptable opinion to be rendered relative to the adequacy of reserves and related items.

2. Scope

This actuarial guideline applies to reinsurance contracts that cede liabilities pertaining to Covered Policies as that term is defined in Section 4.

3. Exemptions

This actuarial guideline does not apply to the situations described in Subsections A through F.

A. Reinsurance of:

- (1) Policies that satisfy the criteria for exemption set forth in Section 6F or Section 6G of Model #830; and which are issued before the later of:
 - (a) The effective date of Model #787 in the state of domicile of the ceding insurer, and
 - (b) The date on which the ceding insurer begins to apply the provisions of VM-20 to establish the ceded policies' statutory reserves, but in no event later than January 1, 2020;
- (2) Portions of policies that satisfy the criteria for exemption set forth in Section 6E of Model #830 and which are issued before the later of:

¹ In general, reserve financing arrangements are those where the security/assets backing part or all of the reserves have one or more of the following characteristics: such security/assets (1) are issued by the ceding insurer or its affiliates; and/or (2) are not unconditionally available to satisfy the general account obligations of the ceding insurer; and/or (3) create a reimbursement, indemnification or other similar obligation on the part of the ceding insurer or any of its affiliates (other than a payment obligation under a derivative contract acquired in the normal course and used to support and hedge liabilities pertaining to the actual risks in the policies ceded pursuant to the reinsurance arrangement).

- (a) The effective date of Model #787 in the state of domicile of the ceding insurer, and
 - (b) The date on which the ceding insurer begins to apply the provisions of VM-20 to establish the ceded policies' statutory reserves, but in no event later than January 1, 2020;
- (3) Any universal life policy that meets all of the following requirements:
- (a) Secondary guarantee period, if any, is five (5) years or less;
 - (b) Specified premium for the secondary guarantee period is not less than the net level reserve premium for the secondary guarantee period based on the CSO valuation tables and valuation interest rate applicable to the issue year of the policy; and
 - (c) The initial surrender charge is not less than one hundred percent (100%) of the first year annualized specified premium for the secondary guarantee period;
- (4) Credit life insurance;
- (5) Any variable life insurance policy that provides for life insurance, the amount or duration of which varies according to the investment experience of any separate account or accounts; or
- (6) Any group life insurance certificate unless the certificate provides for a stated or implied schedule of maximum gross premiums required in order to continue coverage in force for a period in excess of one year; or
- B. Reinsurance ceded to an assuming insurer that meets the applicable requirements of Section 2D of Model #785; or
- C. Reinsurance ceded to an assuming insurer that meets the applicable requirements of Sections 2A, 2B or 2C, of Model #785, and that, in addition:
- (1) Prepares statutory financial statements in compliance with the NAIC *Accounting Practices and Procedures Manual*, without any departures from NAIC statutory accounting practices and procedures pertaining to the admissibility or valuation of assets or liabilities that increase the assuming insurer's reported surplus and are material enough that they need to be disclosed in the financial statement of the assuming insurer pursuant to *Statement of Statutory Accounting Principles No. 1—Accounting Policies, Risks & Uncertainties and Other Disclosures* ("SSAP No. 1"); and
 - (2) Is not in a Company Action Level Event, Regulatory Action Level Event, Authorized Control Level Event, or Mandatory Control Level Event as those terms are defined in the NAIC *Risk-Based Capital (RBC) for Insurers Model Act* (Model #312) when its RBC is calculated in accordance with the life risk-based capital report including overview and instructions for companies, as the same may be amended by the NAIC from time to time, without deviation; or

- D. Reinsurance ceded to an assuming insurer that meets the applicable requirements of Sections 2A, 2B or 2C, of Model #785, and that, in addition:
- (1) Is not an affiliate, as that term is defined in Section 1A of the NAIC *Insurance Holding Company System Regulatory Model Act* (Model #440), of:
 - (a) The insurer ceding the business to the assuming insurer; or
 - (b) Any insurer that directly or indirectly ceded the business to that ceding insurer;
 - (2) Prepares statutory financial statements in compliance with the NAIC *Accounting Practices and Procedures Manual*;
 - (3) Is both:
 - (a) Licensed or accredited in at least 10 states (including its state of domicile), and
 - (b) Not licensed in any state as a captive, special purpose vehicle, special purpose financial captive, special purpose life reinsurance company, limited purpose subsidiary, or any other similar licensing regime; and
 - (4) Is not, or would not be, below 500% of the Authorized Control Level RBC as that term is defined in Model #312 when its risk-based capital (RBC) is calculated in accordance with the life risk-based capital report including overview and instructions for companies, as the same may be amended by the NAIC from time to time, without deviation, and without recognition of any departures from NAIC statutory accounting practices and procedures pertaining to the admission or valuation of assets or liabilities that increase the assuming insurer's reported surplus; or
- E. Reinsurance ceded to an assuming insurer that meets the requirements of either Section 5B(4)(a) of Model #785, pertaining to certain certified reinsurers or Section 5B(4)(b) of Model #785, pertaining to reinsurers meeting certain threshold size and licensing requirements; or
- F. Reinsurance not otherwise exempt under Subsections A through E if the commissioner, after consulting with the NAIC Financial Analysis Working Group (FAWG) or other group of regulators designated by the NAIC, as applicable, determines under all the facts and circumstances that all of the following apply:
- (1) The risks are clearly outside of the intent and purpose of this actuarial guideline (as described in the Authority, Avoidance and Purpose section above);
 - (2) The risks are included within the scope of this actuarial guideline only as a technicality; and
 - (3) The application of this actuarial guideline to those risks is not necessary to provide appropriate protection to policyholders. The commissioner shall publicly disclose any decision made pursuant to this Section 3F to exempt a reinsurance

treaty from this actuarial guideline, as well as the general basis therefor (including a summary description of the treaty).

Drafting Note: *The exemption set forth in Section 3F was added to address the possibility of unforeseen or unique transactions. This exemption exists because the NAIC recognizes that foreseeing every conceivable type of reinsurance transaction is impossible; that in rare instances unanticipated transactions might get caught up in this actuarial guideline purely as a technicality; and that regulatory relief in those instances may be appropriate. The example that was given at the time this exemption was developed pertained to bulk reinsurance treaties where the ceding insurer was exiting the type of business ceded. The exemption should not be used with respect to so-called “normal course” reinsurance transactions; rather, such transactions should either fit within one of the standard exemptions set forth in Sections 3A, B, C, D, or E or meet the substantive requirements of this actuarial guideline.*

4. Definitions

- A. “Actuarial Method” means the methodology used to determine the Required Level of Primary Security, as described in Section 5.
- B. “Covered Policies” means the following: Subject to the exemptions described in Section 3, Covered Policies are those policies, other than Grandfathered Policies, of the following policy types:
- (1) Life insurance policies with guaranteed nonlevel gross premiums and/or guaranteed nonlevel benefits, except for flexible premium universal life insurance policies; or,
 - (2) Flexible premium universal life insurance policies with provisions resulting in the ability of a policyholder to keep a policy in force over a secondary guarantee period.
- Note: Although “Covered Policies” is defined to include all the policies described in Subsections B1 and B2 above, it is noted that whether a given “Covered Policy” is subject to this actuarial guideline or, instead, to Model #787 should be determined under Section 8 (Sunset).*
- C. “Grandfathered Policies” means policies of the types described in Subsections B1 and B2 above that were:
- (1) Issued prior to January 1, 2015; and
 - (2) Ceded, as of December 31, 2014, as part of a reinsurance treaty that would not have met one of the exemptions set forth in Section 3 had that section then been in effect.
- D. “Non-Covered Policies” means any policy that does not meet the definition of Covered Policies, including Grandfathered Policies.
- E. “Required Level of Primary Security” means the dollar amount determined by applying the Actuarial Method to the risks ceded with respect to Covered Policies, but not more than the total reserve ceded.

- F. “Primary Security” means the following forms of security:
- (1) Cash meeting the requirements of Section 3A of Model #785;
 - (2) Securities listed by the Securities Valuation Office meeting the requirements of Section 3B of Model #785, but excluding any synthetic letter of credit, contingent note, credit-linked note or other similar security that operates in a manner similar to a letter of credit, and excluding any securities issued by the ceding insurer or any of its affiliates; and
 - (3) For security held in connection with funds-withheld and modified coinsurance reinsurance treaties:
 - (a) Commercial loans in good standing of CM3 quality and higher;
 - (b) Policy Loans; and
 - (c) Derivatives acquired in the normal course and used to support and hedge liabilities pertaining to the actual risks in the policies ceded pursuant to the reinsurance treaty.
- G. “Other Security” means any security acceptable to the commissioner other than security meeting the definition of Primary Security.
- H. “*Valuation Manual*” means the valuation manual adopted by the NAIC as described in Section 11B(1) of the Standard Valuation Law, with all amendments adopted by the NAIC that are effective for the financial statement date on which credit for reinsurance is claimed.
- I. “VM-20” means “Requirements for Principle-Based Reserves for Life Products,” including all relevant definitions, from the *Valuation Manual*.

5. The Actuarial Method

A. Description of Actuarial Method

The Actuarial Method to establish the Required Level of Primary Security for each reinsurance treaty subject to this actuarial guideline shall be VM-20, applied on a treaty-by-treaty basis, including all relevant definitions, from the *Valuation Manual* as then in effect, applied as follows:

- (1) For Covered Policies described in Section 4B(1) above, the Actuarial Method is the greater of the Deterministic Reserve or the Net Premium Reserve (NPR) regardless of whether the criteria for exemption testing can be met. However, if the Covered Policies do not meet the requirements of the Stochastic Reserve exclusion test in the *Valuation Manual*, then the Actuarial Method is the greatest of the Deterministic Reserve, the Stochastic Reserve, or the NPR. In addition, if such Covered Policies are reinsured in a reinsurance treaty that also contains Covered Policies described in Section 4B(2) above, the ceding insurer may elect to instead use paragraph 2 below as the Actuarial Method for the entire reinsurance agreement. Whether Paragraph 1 or 2 are used, the Actuarial Method must comply with any requirements or restrictions that the *Valuation Manual* imposes when aggregating these policy types for purposes of principle-based

reserve calculations. The mortality basis for the NPR shall be the 2017 CSO Mortality Table.

- (2) For Covered Policies described in Section 4B(2) above, the Actuarial Method is the greatest of the Deterministic Reserve, the Stochastic Reserve, or the NPR regardless of whether the criteria for exemption testing can be met. The mortality basis for the NPR shall be the 2017 CSO Mortality Table.
- (3) Except as provided in Paragraph (4) below, the Actuarial Method is to be applied on a gross basis to all risks with respect to the Covered Policies as originally issued or assumed by the ceding insurer.
- (4) If the reinsurance treaty cedes less than one hundred percent (100%) of the risk with respect to the Covered Policies then the Required Level of Primary Security may be reduced as follows:
 - (a) If a reinsurance treaty cedes only a quota share of some or all of the risks pertaining to the Covered Policies, the Required Level of Primary Security, as well as any adjustment under Subparagraph (c) below, may be reduced to a pro rata portion in accordance with the percentage of the risk ceded;
 - (b) If the reinsurance treaty in a non-exempt arrangement cedes only the risks pertaining to a secondary guarantee, the Required Level of Primary Security may be reduced by an amount determined by applying the Actuarial Method on a gross basis to all risks, other than risks related to the secondary guarantee, pertaining to the Covered Policies, except that for Covered Policies for which the ceding insurer did not elect to apply the provisions of VM-20 to establish statutory reserves, the Required Level of Primary Security may be reduced by the statutory reserve retained by the ceding insurer on those Covered Policies, where the retained reserve of those Covered Policies should be reflective of any reduction pursuant to the cession of mortality risk on a yearly renewable term basis in an exempt arrangement;
 - (c) If a portion of the Covered Policy risk is ceded to another reinsurer on a yearly renewable term basis in an exempt arrangement, the Required Level of Primary Security may be reduced by the amount resulting by applying the Actuarial Method including the reinsurance section of VM-20 to the portion of the Covered Policy risks ceded in the exempt arrangement, except that for Covered Policies issued prior to Jan 1, 2017, this adjustment is not to exceed $[c_x / (2 * \text{number of reinsurance premiums per year})]$ where c_x is calculated using the same mortality table used in calculating the Net Premium Reserve; and
 - (d) For any other treaty ceding a portion of risk to a different reinsurer, including but not limited to stop loss, excess of loss and other non-proportional reinsurance treaties, there will be no reduction in the Required Level of Primary Security.

It is possible for any combination of Subparagraphs (a), (b), (c), and (d) above to apply. Such adjustments to the Required Level of Primary Security will be done in the sequence that accurately reflects the portion of the risk ceded via the treaty.

The ceding insurer should document the rationale and steps taken to accomplish the adjustments to the Required Level of Primary Security due to the cession of less than one hundred percent (100%) of the risk.

The Adjustments for other reinsurance will be made only with respect to reinsurance treaties entered into directly by the ceding insurer. The ceding insurer will make no adjustment as a result of a retrocession treaty entered into by the assuming insurers.

- (5) In no event will the Required Level of Primary Security resulting from application of the Actuarial Method exceed the amount of statutory reserves ceded.
- (6) If the ceding insurer cedes risks with respect to Covered Policies, including any riders, in more than one reinsurance treaty subject to this actuarial guideline, in no event will the aggregate Required Level of Primary Security for those reinsurance treaties be less than the Required Level of Primary Security calculated using the Actuarial Method as if all risks ceded in those treaties were ceded in a single treaty subject to this actuarial guideline.
- (7) If a reinsurance treaty subject to this actuarial guideline cedes risk on both Covered and Non-Covered Policies:
 - (a) The Actuarial Method shall be used to determine the Required Level of Primary Security for the Covered Policies; and
 - (b) Any Primary Security and/or Other Security used to meet any requirements pertaining to the Non-Covered Policies may not be used to satisfy any requirements related to the Required Level of Primary Security and/or Other Security for the Covered Policies.

B. Valuation Used for Purposes of Calculations

For the purposes of both calculating the Required Level of Primary Security pursuant to the Actuarial Method and determining the amount of Primary Security and Other Security, as applicable, held by or on behalf of the ceding insurer, the following shall apply:

- (1) For assets, including any such assets held in trust, that would be admitted under the NAIC *Accounting Practices and Procedures Manual* if they were held by the ceding insurer, the valuations are to be determined according to statutory accounting procedures as if such assets were held in the ceding insurer's general account and without taking into consideration the effect of any prescribed or permitted practices; and
- (2) For all other assets, the valuations are to be those that were assigned to the assets for the purpose of determining the amount of reserve credit taken. In addition, the asset spread tables and asset default cost tables required by VM-20 shall be included in the Actuarial Method if adopted by the NAIC's Life Actuarial (A) Task Force no later than the December 31 on or immediately preceding the valuation date for which the Required Level of Primary Security is being

calculated. The tables of asset spreads and asset default costs shall be incorporated into the Actuarial Method in the manner specified in VM-20.

6. Required Actuarial Analysis and Actuarial Opinion and Memorandum Requirements

A. Required Actuarial Analysis

Before the due date of each actuarial opinion, as to each reinsurance treaty in which Covered Policies have been ceded, the appointed actuary of each ceding insurer must perform an analysis on a treaty by treaty basis, of such Covered Policies to determine whether, as of the immediately preceding December 31 (the valuation date):

- (1) Funds consisting of Primary Security, in an amount at least equal to the Required Level of Primary Security, are held by or on behalf of the ceding insurer, as security under the reinsurance treaty within the meaning of Section 3 of Model #785, on a funds withheld, trust, or modified coinsurance basis; and
- (2) Funds consisting of Other Security, in an amount at least equal to any portion of the statutory reserves as to which Primary Security is not held pursuant to Paragraph (1) above, are held by or on behalf of the ceding insurer as security under the reinsurance treaty within the meaning of Section 3 of Model #785; and

Note: For the sake of clarity, funds consisting of Primary Security pursuant to Paragraphs (1) may exceed the Required Level of Primary Security, and Other Security is only required under Paragraph (2) to the extent that there is any portion of the statutory reserves as to which Primary Security is not so held. For example, if a ceding insurer's statutory reserves equal \$1 Billion, its Required Level of Primary Security is \$600 Million, and it holds \$1 Billion in Primary Security pursuant to Paragraph (1), no Other Security is required under Paragraph (2).

- (3) Any trust used to satisfy the requirements of this Section 6 complies with all of the conditions and qualifications of Section 11 of the NAIC *Credit for Reinsurance Model Regulation* (Model #786), except that:
 - (a) Funds consisting of Primary Security or Other Security held in trust, shall for the purposes identified in Section 5B, be valued according to the valuation rules set forth in Section 5B, as applicable; and
 - (b) There are no affiliate investment limitations with respect to any security held in such trust if such security is not needed to satisfy the requirements of Section 6A(1); and
 - (c) The reinsurance treaty must prohibit withdrawals or substitutions of trust assets that would leave the fair market value of the Primary Security within the trust (when aggregated with Primary Security outside the trust that is held by or on behalf of the ceding insurer in the manner required by Section 6A(1)) below 102% of the level required by Section 6A(1) at the time of the withdrawal or substitution.

B. Qualified Actuarial Opinion; Remediation

- (1) The appointed actuary of the ceding insurer performing the analysis required by Section 6A above must issue a qualified actuarial opinion as described in Section 6.D. of the AOMR or Section 3A(10) of VM-30 of the *Valuation Manual*, as applicable, unless:

- (a) The requirements of Section 6A(1) and 6(A)(2) were fully satisfied as of the valuation date as to such reinsurance treaty; or
 - (b) Any deficiency has been eliminated before the due date of the Annual Statement to which the valuation date relates through the addition of Primary Security and/or Other Security, as the case may be, in such amount and in such form as would have caused the requirements of Section 6A(1) and 6A(2) to be fully satisfied as of the valuation date; or
 - (c) The ceding insurer has established a liability equal to the excess of the credit for reinsurance taken over the amount of Primary Security actually held pursuant to Section 6A(1).
- (2) In addition to the requirement set forth in Section 6B(1) above, the appointed actuary of the ceding insurer performing the analysis required by Section 6A above must issue a qualified actuarial opinion as described in Section 6.D. of the AOMR or Section 3A(10) of VM-30 of the *Valuation Manual*, as applicable, if the appointed actuary for any affiliated reinsurer of the ceding insurer issues a qualified actuarial opinion with respect to such affiliated reinsurer where (a) the affiliate reinsures Covered Policies of the ceding insurer and (b) the qualified actuarial opinion pertaining to the affiliated reinsurer results, in whole or in part, from the analysis required by this actuarial guideline.

Note: The remediation option set forth in Section 6B(1)(c) mirrors that set forth in Model #787. Under this option, a ceding company may choose to avoid the consequence (a qualified opinion under this actuarial guideline) by establishing a liability equal to the excess of the credit for reinsurance taken over the amount of Primary Security actually held. For example, suppose a ceding insurer has established statutory reserves of \$1 Billion and has Primary Security of \$550 Million and Other Security of \$450 Million. Suppose further that the actuary determines that the insurer's Required Level of Primary Security is \$600 Million. Under Section 6B(1)(c), the insurer may avoid a qualified opinion by establishing a liability equal to \$450 Million (the difference between the statutory reserve of \$1 Billion and the \$550 Million amount of Primary Security actually held).

- C. Additional Requirements for the Actuarial Opinion and Memorandum for Companies that have Covered Policies Requiring the Analysis Pursuant to this actuarial guideline
- (1) In the statement of actuarial opinion, the appointed actuary of the ceding insurer must state whether (i) he has performed an analysis, as to each reinsurance arrangement under which Covered Policies have been ceded, of the security supporting the Covered Policies and whether funds consisting of Primary Security in an amount at least equal to the Required Level of Primary Security are held by or on behalf of the ceding insurer, as security under the reinsurance contract, on a funds withheld, trust, or modified coinsurance basis and (ii) funds consisting of Primary Security or Other Security in an amount equal to the statutory reserves are held by or on behalf of the ceding insurer as security under the reinsurance arrangement.
 - (2) In the actuarial memorandum as described by Section 7 of the AOMR or Section 3B of VM-30 of the *Valuation Manual*, as applicable, the appointed actuary of the ceding insurer must document the analysis and requirements applied by this actuarial guideline as to each reinsurance arrangement under which Covered Policies are ceded.

- (3) In the event that a reinsurance treaty contains both (1) Covered Policies subject to this actuarial guideline rather than to Model #787, and (2) Covered Policies subject to Model #787 rather than to this actuarial guideline, the treaty shall be tested as a whole for purposes of a ceding insurer's compliance with both (a) the requirements of Section 6A(1) and Section 6A(2) of this actuarial guideline and (b) the requirements of Section 7A(3) and Section 7A(4) of Model #787; provided further, that:
- (a) If funds consisting of Primary Security are held in amounts less than the Required Level of Primary Security, such funds consisting of Primary Security shall be allocated first to fulfill the Required Level of Primary Security for the Covered Policies subject to this actuarial guideline, with any remainder allocated to those Covered Policies subject to Model #787; and
 - (b) If funds consisting of Other Security are held in amounts less than the requirements of Section 6A(2), such funds consisting of Other Security shall be allocated first to fulfill the Other Security requirements for the Covered Policies subject to this actuarial guideline, and any remainder shall be allocated to those Covered Policies subject to Model #787.

7. Effective Date

This actuarial guideline shall become effective as of January 1, 2017 with respect to all Covered Policies. This actuarial guideline supersedes and replaces all previous versions thereof with respect to actuarial opinions rendered as to valuation periods ending on or after January 1, 2017.

Note: For the avoidance of doubt, actuarial opinions issued with respect to the year ended December 31, 2016, shall be governed by the version of AG 48 in effect on December 31, 2016, as included in the Accounting Practices and Procedures Manual.

8. Sunset Provision

This actuarial guideline shall cease to apply as to Covered Policies that are both (a) issued by ceding insurers domiciled in a jurisdiction that has in effect, as of December 31st¹ of the calendar year immediately preceding the year in which the actuarial opinion is to be filed, a regulation substantially similar to Model #787 adopted by the NAIC on December 13, 2016; and (b) subject to Model #787 as so adopted by the ceding insurer's jurisdiction of domicile. This Actuarial Guideline shall continue to apply, without interruption, to any and all Covered Policies not included in both (a) and (b) of the immediate preceding sentence.

*Note: It is anticipated that, for most states, this actuarial guideline will sunset pursuant to (a) and (b) of Section 8 and will continue only with respect to the limited number of states in which their version of Model #787 applies prospectively only, i.e., applies only to Covered Policies issued on or after the effective date of their version of Model #787. It is anticipated, however, that most states will be able to adopt a version of Model #787 that, like the Model itself, applies to all Covered Policies (subject to the applicable exemptions and grandfathering provisions) that are "in force" on or after the effective date, even if the policies were originally issued prior to that effective date. The goal of Section 8 is to ensure that **all** Covered Policies ceded in reinsurance transactions within the scope of this actuarial guideline continue to be subject to this actuarial guideline unless and until they become subject to Model #787.*

Actuarial Guideline XLIX

THE APPLICATION OF THE LIFE ILLUSTRATIONS MODEL REGULATION TO POLICIES WITH INDEX-BASED INTEREST

Background

The *Life Insurance Illustrations Model Regulation* (#582) was adopted by the NAIC in 1995. Since that time there has been continued evolution in product design, including the introduction of benefits that are tied to an external index or indices. Although these policies are subject to Model #582, not all of their features are explicitly referenced in the model, resulting in a lack of uniform practice in its implementation. In the absence of uniform guidance, two illustrations that use the same index and crediting method often illustrated different credited rates. The lack of uniformity can be confusing to potential buyers and can cause uncertainty among illustration actuaries when certifying compliance with Model #582.

This guideline provides uniform guidance for policies with index-based interest. In particular, this guideline:

- (1) Provides guidance in determining the maximum crediting rate for the illustrated scale and the earned interest rate for the disciplined current scale.
- (2) Limits the policy loan leverage shown in an illustration.
- (3) Requires additional consumer information (side-by-side illustration and additional disclosures) that will aid in consumer understanding.

Text

1. Effective Date

This Actuarial Guideline shall be effective as follows:

- i. Sections 4 and 5 shall be effective for all new business and in force life insurance illustrations on policies sold on or after September 1, 2015.
- ii. Effective March 1, 2017, Section 4 and Section 5 shall be effective for all in-force life insurance illustrations on policies within the scope of this Actuarial Guideline, regardless of the date the policy was sold.
- iii. Sections 6 and 7 shall be effective for all new business and in force life insurance illustrations on policies sold on or after March 1, 2016.
- iv. This actuarial guideline shall not apply for any new business or in force life insurance illustration on policies sold on or after December 14, 2020.
- v. Notwithstanding part iv of this section, an insurer may choose to utilize AG 49-A guidance for new illustrations on policies sold prior to the effective date of AG 49-A provided that, 1) the insurer utilizes AG 49-A guidance for all new product illustrations subject to AG 49, and 2) the insurer does not revert back to the AG 49 guidance.

2. Scope

This Actuarial Guideline shall apply to any life insurance illustration that meets both (i) and (ii) below:

- i. The policy is subject to Model #582.
- ii. Interest credits are linked to an external index or indices.

3. Definitions

A. **Alternate Scale:** A scale of non-guaranteed elements currently being illustrated such that:

- i. The credited rate for each Index Account does not exceed the lesser of the maximum credited rate for the illustrated scale less 100 basis points and the credited rate for the Fixed Account. If the insurer does not offer a Fixed Account with the illustrated policy, the credited rate for each Index Account shall not exceed the average of the maximum credited rate for the illustrated scale and the guaranteed credited rate for that account. However, the credited rate for each Index Account shall never be less than the guaranteed credited rate for that account.
- ii. If the illustration includes a loan, the illustrated rate credited to the loan balance does not exceed the illustrated loan charge.
- iii. All other non-guaranteed elements are equal to the non-guaranteed elements for the illustrated scale.

B. **Benchmark Index Account:** An Index Account with the following features:

- i. The interest calculation is based on the percent change in S&P 500[®] Index value only, over a one-year period using only the beginning and ending index values. (S&P 500[®] Index ticker: SPX)
- ii. An annual cap is used in the interest calculation.
- iii. The annual floor used in the interest calculation shall be 0%.
- iv. The participation rate used in the interest calculation shall be 100%.
- v. Interest is credited once per year.
- vi. Account charges do not exceed the account charges for any corresponding Index Accounts within the policy in any policy year. If Index Accounts with different levels of account charges are offered with the illustrated policy, more than one Benchmark Index Account may be used in determining the maximum illustrated crediting rates for the policy's Index Accounts, subject to the requirements of paragraph 5 (D). However, for each Index Account within the policy, only one Benchmark Index Account shall apply. Any rate calculated in paragraph 4 (B) shall not apply for an Index Account if the account charges for the applicable Benchmark Index Account exceed the account charges for that Index Account in any policy year. Account charges include all charges applicable to an Index Account, whether deducted from policy values or from premiums or other amounts transferred into such Index Account.

- vii. Additional amounts credited are not less than the additional amounts credited for any corresponding Index Accounts within the policy in any policy year. Any rate calculated in paragraph 4 (B) shall not apply for an Index Account if the additional amounts credited for the applicable Benchmark Index Account are less than the additional amounts credited for that Index Account in any policy year. Additional amounts include all credits that increase policy values, including but not limited to experience refunds or bonuses.
- viii. There are no limitations on the portion of account value allocated to the account.

- C. **Fixed Account:** An account where the credited rate is not tied to an external index or indices.
- D. **Index Account:** An account where the credited rate is tied to an external index or indices.

4. Illustrated Scale

The credited rate for the illustrated scale for each Index Account shall be limited as follows:

- A. Calculate the geometric average annual credited rate for each applicable Benchmark Index Account for the 25-year period starting on 12/31 of the calendar year that is 66 years prior to the current calendar year (e.g., 12/31/1949 for 2015 illustrations) and for each 25-year period starting on each subsequent trading day thereafter, ending with the 25-year period that ends on 12/31 of the prior calendar year.
 - i. If the insurer offers an applicable Benchmark Index Account with the illustrated policy, the illustration actuary shall use the current annual cap for the applicable Benchmark Index Account in paragraph 4 (A).
 - ii. If the insurer does not offer an applicable Benchmark Index Account with the illustrated policy, the illustration actuary shall use actuarial judgment to determine a hypothetical, supportable current annual cap for a hypothetical, supportable Index Account that meets the definition of a Benchmark Index Account, and shall use that cap in paragraph 4 (A).
- B. For each applicable Benchmark Index Account, the arithmetic mean of the geometric average annual credited rates calculated in paragraph 4 (A) shall be the maximum credited rate(s) for the illustrated scale.
- C. For other Index Accounts using other equity, bond, and/or commodity indexes, and/or using other crediting methods, the illustration actuary shall use actuarial judgment to determine the maximum credited rate for the illustrated scale. The determination shall reflect the fundamental characteristics of the Index Account and the parameters shall have the appropriate relationship to the expected risk and return of the applicable Benchmark Index Account. In no event shall the credited rate for the illustrated scale exceed the applicable rate calculated in paragraph 4 (B).
- D. At the beginning of each calendar year, the insurer shall be allowed up to three (3) months to update the credited rate for each Index Account in accordance with paragraphs 4 (B) and 4 (C).

5. Disciplined Current Scale

The earned interest rate for the disciplined current scale shall be limited as follows:

- A. If an insurer engages in a hedging program for index-based interest, the assumed earned interest rate underlying the disciplined current scale shall not exceed 145% of the annual

net investment earnings rate (gross portfolio earnings less provisions for investment expenses and default costs) of the general account assets (excluding hedges for index-based credits) allocated to support the policy.

- B. If an insurer does not engage in a hedging program for index-based interest, the assumed earned interest rate underlying the disciplined current scale shall not exceed the annual net investment earnings rate of the general account assets allocated to support the policy.
- C. These experience limitations shall be included when testing for self-support and lapse-support under Model #582, accounting for all benefits including illustrated bonuses.
- D. If more than one Benchmark Index Account is used for an illustrated policy, each set of Index Accounts that correspond to each Benchmark Index Account must independently pass the self-support and lapse-support tests under Model #582, subject to the limitations in paragraphs 5 (A), 5 (B) and 5 (C). All experience assumptions that do not directly relate to the Index Accounts as to expenses, mortality, investment earnings rate of the general account assets, lapses, and election of any Fixed Account shall equal the assumptions used in the testing for the entire policy.

6. Policy Loans

If the illustration includes a loan, the illustrated rate credited to the loan balance shall not exceed the illustrated loan charge by more than 100 basis points.

7. Additional Standards

The basic illustration shall also include the following:

- A. A ledger using the Alternate Scale shall be shown alongside the ledger using the illustrated scale with equal prominence.
- B. A table showing the minimum and maximum of the geometric average annual credited rates calculated in paragraph 4 (A).
- C. For each Index Account illustrated, a table showing actual historical index changes and corresponding hypothetical interest rates using current index parameters for the most recent 20-year period.

Actuarial Guideline XLIX-A

THE APPLICATION OF THE LIFE ILLUSTRATIONS MODEL REGULATION TO POLICIES WITH INDEX-BASED INTEREST SOLD (On or After December 14, 2020)

Background

The *Life Insurance Illustrations Model Regulation* (#582) was adopted by the NAIC in 1995. Since that time there has been continued evolution in product design, including the introduction of benefits that are tied to an index or indices. Although these policies are subject to Model #582, not all of their features are explicitly referenced in the model, resulting in a lack of uniform practice in its implementation. In the absence of uniform guidance, two illustrations that use the same index and crediting method often illustrated different credited rates. The lack of uniformity can be confusing to potential buyers and can cause uncertainty among illustration actuaries when certifying compliance with Model #582.

In 2019, the NAIC decided that illustrations of products with multipliers, cap buy-ups, and other enhancements that are linked to an index or indices should not illustrate better than products without such features. This new requirement is intended to apply to illustrations on policies sold on or after the effective date of this guideline while the existing requirements continue to apply for inforce illustrations on policies sold before the effective date of this guideline.

This guideline provides uniform guidance for policies with index-based interest. In particular, this guideline:

- (1) Provides guidance in determining the maximum crediting rate for the illustrated scale and the earned interest rate for the disciplined current scale.
- (2) Limits the policy loan leverage shown in an illustration.
- (3) Requires additional consumer information (side-by-side illustration and additional disclosures) that will aid in consumer understanding.

Text

1. Effective Date

This Actuarial Guideline shall be effective for all new business and in force illustrations on policies sold on or after December 14, 2020.

2. Scope

This Actuarial Guideline shall apply to any life insurance illustration that meets both (i) and (ii), below:

- i. The policy is subject to Model #582.
- ii. The policy offers Indexed Credits.

3. Definitions

- A. Alternate Scale: A scale of non-guaranteed elements currently being illustrated such that:
 - i. The Annual Rate of Indexed Credits for each Index Account does not exceed the lesser of the maximum Annual Rate of Indexed Credits for the illustrated scale less

100 basis points and the credited rate for the Fixed Account. If the insurer does not offer a Fixed Account with the illustrated policy, the Annual Rate of Indexed Credits for each Index Account shall not exceed the average of the maximum Annual Rate of Indexed Credits for the illustrated scale and the guaranteed Annual Rate of Indexed Credits for that account. However, the Annual Rate of Indexed Credits for each Index Account shall never be less than the guaranteed Annual Rate of Indexed Credits for that account.

- ii. If the illustration includes a loan, the illustrated Policy Loan Interest Credited Rate shall not exceed the illustrated Policy Loan Interest Rate. For example, if the illustrated Policy Loan Interest Rate is 4%, the Policy Loan Interest Credited Rate shall not exceed 4%.
 - iii. All other non-guaranteed elements are equal to the non-guaranteed elements for the illustrated scale.
- B. Annual Net Investment Earnings Rate: Gross portfolio annual earnings rate of the general account assets (excluding hedge assets for Indexed Credits), less provisions for investment expenses and default cost, allocated to support the policy. Charges of any kind cannot be used to increase the Annual Net Investment Earnings Rate.
- C. Annual Rate of Indexed Credits: The total annualized Indexed Credits expressed as a percentage of the account value used to determine the Indexed Credits.
- D. Benchmark Index Account: An Index Account with the following features:
- i. The interest calculation is based on the percent change in S&P 500[®] Index value only, over a one-year period using only the beginning and ending index values. (S&P 500[®] Index ticker: SPX)
 - ii. An annual cap is used in the interest calculation.
 - iii. The annual floor used in the interest calculation shall be 0%.
 - iv. The participation rate used in the interest calculation shall be 100%.
 - v. Interest is credited once per year.
 - vi. The Hedge Budget used to determine the cap in 3 (D) (ii) does not exceed the Annual Net Investment Earnings Rate. Charges of any kind cannot be used to increase the annual cap.
 - vii. There are no enhancements or similar features that provide additional Indexed Credits in excess of the interest provided by 3 (D) (i) through 3 (D) (v), including but not limited to experience refunds, multipliers, or bonuses.
 - viii. There are no limitations on the portion of account value allocated to the account.
 - ix. A single Benchmark Index Account will be determined for each policy. This can be either an Index Account offered with the illustrated policy or determined according to Section 4 (A) (ii) for purposes of complying with this guideline. A policy shall have no more than one Benchmark Index Account.

- E. Fixed Account: An account where there are no Indexed Credits.
 - F. Hedge Budget: For each Index Account, the total annualized amount assumed to be used to generate the Indexed Credits of the account, expressed as a percent of the account value in the Index Account. This total annualized amount should be consistent with the hedging program of the company.
 - G. Index Account: An account where some or all of the amounts credited are Indexed Credits.
 - H. Indexed Credits: Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices. Amounts credited to the policy resulting from a floor greater than zero on an account with any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices are included.
 - I. Loan Balance: Any outstanding policy loan and loan interest, as defined in the policy.
 - J. Policy Loan Interest Rate: The current annual interest rate as defined in the policy that is charged on any Loan Balance. This does not include any other policy charges.
 - K. Policy Loan Interest Credited Rate: The annualized interest rate credited that applies to the portion of the account value backing the Loan Balance:
 - i. For the portion of the account value in the Fixed Account that is backing the Loan Balance, the Policy Loan Interest Credited Rate is the applicable annual interest crediting rate.
 - ii. For the portion of the account value in an Index Account that is backing the Loan Balance, the Policy Loan Interest Credited Rate is the Annual Rate of Indexed Credits, net of any applicable Supplemental Hedge Budget, for that account.
 - L. Supplemental Hedge Budget: For each Index Account, the Hedge Budget minus the minimum of the Annual Net Investment Earnings Rate and the Hedge Budget that is used in the determination of the Benchmark Index Account. The Supplemental Hedge Budget will never be less than zero. This amount should be consistent with the hedging program of the company.
4. Illustrated Scale

The total Annual Rate of Indexed Credits for the illustrated scale for each Index Account shall be limited as follows:

- A. Calculate the geometric average annual credited rate for the Benchmark Index Account for the 25-year period starting on 12/31 of the calendar year that is 66 years prior to the current calendar year (e.g., 12/31/1949 for 2015 illustrations) and for each 25-year period starting on each subsequent trading day thereafter, ending with the 25-year period that ends on 12/31 of the prior calendar year.
 - i. If the insurer offers a Benchmark Index Account with the illustrated policy, the illustration actuary shall use the current annual cap for the Benchmark Index Account in 4 (A).
 - ii. If the insurer does not offer a Benchmark Index Account with the illustrated policy, the illustration actuary shall use actuarial judgment to determine a hypothetical,

supportable current annual cap for a hypothetical, supportable Index Account that meets the definition of the Benchmark Index Account, and shall use that cap in 4 (A).

- B. For the Benchmark Index Account the Annual Rate of Indexed Credits shall not exceed the minimum of (i) and (ii):
- i. The arithmetic mean of the geometric average annual credited rates calculated in 4 (A).
 - ii. 145% of the Annual Net Investment Earnings Rate.
- C. For any other Index Account that is not the Benchmark Index Account in 3 (D), the Annual Rate of Indexed Credits illustrated as a percentage of the account value in the Index Account prior to the deduction of any charges used to fund a Supplemental Hedge Budget shall not exceed the minimum of (i) and (ii):
- i. The Annual Rate of Indexed Credits for the Benchmark Index Account calculated in 4 (B) plus the Supplemental Hedge Budget for the Index Account.
 - ii. The Annual Rate of Indexed Credits reflecting the fundamental characteristics of the Index Account and the appropriate relationship to the expected risk and return of the Benchmark Index Account. The illustration actuary shall use actuarial judgment to determine this value using lookback methodology consistent with 4 (A) and 4 (B) (i) where appropriate.
- D. For the purposes of compliance with Section 6 (C) of Model #582, the Supplemental Hedge Budget is subtracted from the Annual Rate of Indexed Credits before comparing to the earned interest rate underlying the disciplined current scale.

At the beginning of each calendar year, the insurer shall be allowed up to three (3) months to update the credited rate for each Index Account in accordance with 4 (B) and 4 (C).

5. Disciplined Current Scale

The earned interest rate for the disciplined current scale shall be limited as follows:

- A. If an insurer engages in a hedging program for Indexed Credits in an account, the assumed earned interest rate underlying the disciplined current scale for that account, inclusive of all general account assets, both hedge and non-hedge assets, that support the policy, net of default costs and investment expenses (including the amount spent to generate the Indexed Credits of the policy) shall not exceed the lesser of (i) and (ii):
- i. The Annual Net Investment Earnings Rate, plus 45% of the lesser of (1) and (2):
 1. Hedge Budget minus any annual floor, to the extent that the floor is supported by the Hedge Budget.
 2. The minimum of the Annual Net Investment Earnings Rate and the Hedge Budget that is used in the determination of the Benchmark Index Account.

- ii. The Annual Rate of Indexed Credits plus the Annual Net Investment Earnings Rate minus the Hedge Budget.

These rates should be adjusted for timing differences in the hedge cash flows to ensure that fixed interest is not earned on the Hedge Budget minus any annual floor, to the extent that the floor is supported by the Hedge Budget.

Guidance Note: The above approach does not stipulate any required methodology as long as it produces a consistent limit on the assumed earned interest rate underlying the disciplined current scale.

For a policy with multiple Index Accounts, a maximum rate in 5 (A) should be calculated for each account. All accounts, fixed and indexed, within a policy can be tested in aggregate.

- B. If an insurer does not engage in a hedging program for Indexed Credits, the assumed earned interest rate underlying the disciplined current scale shall not exceed the Annual Net Investment Earnings Rate.
- C. These experience limitations shall be included when testing for self-support and lapse-support under Model #582, accounting for all illustrated benefits including any illustrated benefits and bonuses that impact the policy's account value.

6. Policy Loans

If the illustration includes a loan, the illustrated Policy Loan Interest Credited Rate shall not exceed the illustrated

Policy Loan Interest Rate by more than 50 basis points. For example, if the illustrated Policy Loan Interest Rate is 4.00%, the Policy Loan Interest Credited Rate shall not exceed 4.50%.

7. Additional Standards

The basic illustration shall also include the following:

- A. A ledger using the Alternate Scale shall be shown alongside the ledger using the illustrated scale with equal prominence.
- B. A table showing the minimum and maximum of the geometric average annual credited rates calculated in 4 (A).
- C. For each Index Account illustrated, a table showing actual historical index changes and corresponding hypothetical Indexed Credits using current index parameters for the most recent 20-year period.

Actuarial Guideline L

2013 INDIVIDUAL DISABILITY INCOME VALUATION TABLE ACTUARIAL GUIDELINE

A. Background

The 2013 IDI Valuation Table, as included in the *Health Insurance Reserves Model Regulation* (#10), is the valuation standard to replace the 1985 Commissioner's Individual Disability Tables (85CIDA/85CIDC). The link below brings one to the 2013 IDI Valuation Table workbook and instructions:

http://www.naic.org/documents/01_2013_idi_valuation_table_workbook_and_instructions_version_1_3.zip

An actuarial guideline is more appropriate to handle the multiple segments of the 2013 IDI Valuation Table, the computations of own experience, the application of credibility, and successor updates to the table, which are not normally found in model regulations.

B. Purpose

The purpose of this actuarial guideline is to provide instructions for the use of the 2013 IDI Valuation Table that is referenced in the *Health Insurance Reserves Model Regulation* (#10). This guideline pertains to IDI claims consistent with the conditions defined in the model regulation and governs the selection of claim termination rates for the purpose of calculating IDI claim reserves. This guideline does not address reserve adequacy, which remains the concern of the insurer according to the terms expressed in the model regulation.

Although the various detailed formulas in this guideline do not address or define reserve adequacy directly, it is assumed that appropriate adequacy tests will be made periodically. Such adequacy testing is considered to be an additional tool for the actuary to make appropriate choices in cases in which leeway from any prescription made herein is allowed (A/E calculation, margin, etc.) so that the calculation of the reserve generally will be adequate and the actuary does not need to continually rely on other measures to achieve adequacy. In addition to the instances in which leeway from prescription is mentioned below, nothing in this guideline should be assumed to prohibit the actuary from building a case and requesting permission from the state insurance commissioner for other appropriate variations. Many such situations, because they would apply to fully credible blocks of business and are intended for continual use, should be considered for approval by the commissioner for a period tied to the updates required by section C.vi. of this guideline and not approved on an annual basis.

When the insurer follows the instructions provided in this guideline, the selected claim termination rates meet the minimum valuation standard defined in the model regulation.

C. Valuation Table Modifications

If not invoking the own experience measurement exemption exception specified in section E of this guideline, a company should use a credibility weighted combination of its own claim termination experience with the 2013 IDI Valuation Table to create its specific valuation table for the purpose of calculating disabled life reserve (DLR).

For claims in duration group 1 (months 1 to 12 following disability incurral) or greater, the valuation termination rates are computed using the termination rates from the 2013 IDI Valuation Table (S) multiplied by experience adjustment factors (T) that are calculated separately for four different duration groups.

$$\text{Valuation Termination Rate} = T \times S$$

The duration groups are defined as follows:

- Group 1: duration 1 to 12 months
- Group 2: duration > 12 months and duration <= 24 months
- Group 3: duration > 24 months and duration <= 60 months
- Group 4: duration > 60 months and duration <= 120 months
- Group 5: duration > 120 months

S is the claim termination rates from the 2013 IDI Valuation Table; and

T is computed as $T = [Z \times F * (1-M) + (1 - Z)]$.

Z is a credibility weighting factor, between 0 and 1, developed for each duration group according to the following specifications:

Group 1-5: $Z = \text{Min} \left(\sqrt{N/K}, 1 \right)$ N is the number of expected claimant termination counts from the 2013 IDI Valuation Table.

K is a set of constants defined by duration group as follows:

- Group 1 and 2: $K = 3,300$
- Group 3: $K = 2,500$
- Group 4: $K = 2,100$
- Group 5: $K = 1,700$

F is the ratio of the company's actual total of termination counts to the expected termination counts for the 2013 IDI Valuation Table for each duration group specified above;

The A/E ratio (F) is to be determined based on monthly indemnity. If the actuary has reserve adequacy or other significant analysis that demonstrates that some other weighting of claims (claim or claimant counts, gross benefit, net benefit, etc.) is appropriate for measuring A/E, and also is expected to produce reserves not less than those produced by using a monthly indemnity measurement, such alternative measurement is deemed appropriate. If the actuary cannot produce A/E ratios based on monthly indemnity and only based on claim count or claimant count, an adjustment factor on 0.962 should be multiplied by the A/E ratios in each duration segment to convert them to an indemnity basis. The 0.962 factor is based on the observed relationship for indemnity- versus count-based claim termination experience in the IDI Valuation Table.

M is the company experience margin, determined for each duration group 2 or greater according to the following formula:

$$M = \text{Min} \left(15\%, \text{Max} \left(5\%, 3\% + 1.65 * \sqrt{A/C} \right) \right)$$

This is the minimum value for the definition of M prior to any reserve adequacy analysis. Adequacy tests and analysis of experience (sharpness of fluctuations, trends over the period of the termination rate study, changing claims practices, etc.) may indicate that a larger value of M may be more appropriate. If so, such a value is deemed appropriate. For duration group 1 (1 to 12 months), M is 5 percent, the same as the 2013 IDI Valuation Table margin for duration 1.

A is a set of constants defined by duration group as follows:

- Group 1 and 2: $A = 4.0$
- Group 3: $A = 3.0$
- Group 4: $A = 2.5$
- Group 5: $A = 2.0$

C is the company's actual number of total claimant termination counts by duration group. If an actuary cannot directly determine claimant termination counts, he or she may approximate it using the average number of claims per claimant for their block of claims.

The company should not use termination rates that produce total reserves for claims disabled for more than two years that are less than the reserves produced for these claims by computing T as $T = 1.30$.

D. Company-Specific Experience—Own Company Experience Measurement

In computing values F and S to comply with section B of this guideline, the appointed actuary should:

1. Segment the company claim termination experience into any major subgroup that may produce significantly different results (e.g., market niches, risk management practices, unique benefit designs, etc.);
2. Combine affiliated statutory entities and assumed reinsurance, in which claim management is under a common structure, when considering company experience. It also is appropriate to evaluate experience separately when specific blocks of company business have distinct risk management practices or significantly different risk characteristics;
3. Include all relevant experience the company is capable of providing for as many of the last five years (not including the lag period described below) as is appropriate;
4. Include a suitable lag period. Some claims may close retroactively, and others initially thought to be closed may reopen retroactively. Therefore, based on company experience, a suitable lag period is needed. The appointed actuary may use a lag period of up to 12 months if company experience shows it is appropriate. The five-year period mentioned above does not include the lag period;
5. Measure A/E based on monthly indemnity consistent with the development of the 2013 IDI Valuation Table. The A/E ratio is defined as the ratio of actual claim termination experience to the expected claim termination experience, according to the 2013 IDI Valuation Table with margin (by disability duration grouping). The A/E ratio is referred to as the variable F in section B, paragraph 4 of this guideline. For companies that can develop A/E studies only based on claim termination counts, an adjustment factor of 0.962 should be multiplied by their A/E ratio for each claim duration to convert it to an indemnity basis. The 0.962 factor was developed based on the relationship of the indemnity-based A/E to count-based A/E for the industry table;
6. In calculating expected claim terminations based on the 2013 IDI Valuation Table, companies should use all variables and modifiers with two exceptions:
 - a. If a company has not maintained appropriate diagnosis codes on historical claim records, the company may set the diagnosis CTR modifier to 1.00.

- b. If a company has not maintained appropriate occupation codes on historical claim records to identify occupations and assign them to the five occupation classes of the 2013 IDI Valuation Table consistent with definitions of these occupation classes, the company may assign claims to Occ Classes 1, 2, 3, and 4 based on the way the company has assigned claims to the 85CIDA occupation classes.
7. Assign credibility based on claimant termination counts, and not monthly indemnity terminated. Companies should use claimant termination counts and not claim termination counts in determining the number of terminations for their own company experience credibility. Each company will need to make appropriate adjustments based on its average number of claims per claimant if it is not able to determine claimant termination counts directly and can only directly measure claim termination counts. For example, on average, if a company has 1.5 open claims per claimant and if it had 100 claim terminations in a duration segment over its five-year study period, it would divide 100 by 1.5 and use 67 claimant terminations when determining credibility;
8. Update the minimum valuation basis in accordance with section B of this guideline at least once every five years. In addition, the valuation basis also should be updated whenever the company's annual own experience study produces, in accordance with section B, a value T that changes by more than 10 percent from the one used in the current valuation basis for any of the five duration groups. All claims valued using the 2013 IDI Valuation Table share the same company experience factors. When the company experience factors are updated, the new factors apply to all claims valued using the 2013 table, including claims incurred prior to the update of the experience factors;
9. Do not count as terminations those claims that are closed due to settlement (i.e., a lump sum replacing a series of potential future payments); that have reached the end of the maximum benefit duration; or that are closed due to a contractual limitation, such as a mental disorder limitation. For this purpose, a termination due to a change in definition of disability is not considered a termination due to reaching the maximum benefit duration. Terminations of residual or partial disability claims count as total disability terminations. Changes in the definition of disability do not count as a termination unless the claim actually terminates. If a claim closes when the definition of disability changes, that is counted as a claim termination;
10. Use experience that is otherwise relevant in accordance with the professional judgment of the appointed actuary;
11. Do not use experience that the commissioner has deemed inappropriate or likely to produce significantly inadequate reserves; and
12. In the above paragraphs, the term "company" refers to a single company or a group of legally related companies subject to the same claim management.

E. Own Experience Measurement Exemption

If, at the time of valuation, a company has fewer than 50 open claimants disabled within two years of the effective date of the valuation, and fewer than 200 open claimants disabled more than two years prior to the effective date of the valuation, the insurer is exempt from the requirement that the 2013 IDI Valuation Table be modified by the company's own experience. Said company should use 100 percent of the 2013 IDI Valuation Table for calculating claims termination rates in order to comply with the minimum valuation standard. This exemption is determined at the statutory company level and not at any segmented level that might be used in determining the own experience modifier.

Actuarial Guideline LI

THE APPLICATION OF ASSET ADEQUACY TESTING TO LONG-TERM CARE INSURANCE RESERVES

Background

The *Health Insurance Reserves Model Regulation (#010)* and the *NAIC Valuation Manual (VM-25)* contain requirements for the calculation of long-term care insurance (LTC) reserves. Regulators have observed a lack of uniform practice in the implementation of tests of reserve adequacy and reasonableness of LTC reserves. The reserve adequacy testing required by Model #10 and VM-25 does not provide regulators comfort as to the reserve adequacy of companies with material blocks of LTC business. As such, regulators must rely upon asset adequacy analysis required by the *NAIC Valuation Manual (VM-30)* to evaluate the solvency position of companies with sizable blocks of LTC business. This Guideline is intended to provide uniform guidance and clarification of requirements for the appropriate support of certain assumptions for the asset adequacy testing applied to a company's LTC block of contracts. In particular, this Guideline:

- (1) Specifies that the appropriate form of asset adequacy analysis may be in the form of a gross premium valuation or in a more robust form, such as cash-flow testing, with Actuarial Standards of Practice providing guidance in this area;
- (2) Clarifies the type of adequacy testing methods that must be used for aggregation with other blocks of business to be allowed for asset adequacy analysis purposes;
- (3) Requires a uniform approach to supporting acceptable assumptions regarding future LTC premium rate increases;
- (4) Provides requirements for documentation of assumptions associated with all key LTC risks; and
- (5) Provides requirements for documentation of standalone LTC asset adequacy testing results.

Note: It is anticipated that the requirements contained in this Guideline will be incorporated into the *NAIC Valuation Manual (VM-30)* at a future date, effective for a future valuation year. This Guideline will cease to apply to annual statutory financial statements at the time the corresponding VM-30 requirements become effective.

Text

1. **Effective Date**

This Guideline shall be effective for reserves reported with the December 31, 2017, and subsequent annual statutory financial statements.

2. **Authority**

Pursuant to Section 1, paragraph 3, of *VM-30* of the *NAIC Valuation Manual*, the commissioner shall have the authority to specify specific methods of actuarial analysis and actuarial assumptions when, in the commissioner's judgment, these specifications are necessary for an acceptable opinion to be rendered relative to the adequacy of reserves and related items.

3. Scope

This Guideline shall apply to a company with over 10,000 inforce lives covered by long-term care insurance contracts as of the valuation date. All long-term care insurance contracts, whether directly written or assumed through reinsurance are included. Accelerated death benefit products or other combination products where the substantial risk of the product is associated with life insurance or an annuity are not subject to this Guideline.

4. Asset Adequacy Analysis of LTC Business

- A. As stated in Actuarial Standard of Practice (ASOP) No. 22, multiple asset adequacy analysis methods, including cash-flow testing and gross premium valuation, are available to actuaries for this analysis.

The method of analysis used for LTC shall conform with ASOP No. 22 in recognition of the typical significant asset and liability-related risks associated with LTC.

- B. Asset adequacy analysis specific to all inforce LTC business, and without consideration of results for other block of business within the company, must be performed for valuations associated with the December 31, 2017, and subsequent annual statutory financial statements. The analysis shall comply with applicable Actuarial Standards of Practice, including standards regarding identification of key risks. Material assumptions associated with the LTC business shall be determined testing moderately adverse deviations in actuarial assumptions.
- C. When determining whether additional reserves are necessary:
1. A reserve deficiency in the LTC block may be aggregated with sufficiencies in the company's other blocks of business for the purposes of developing an actuarial opinion, if cash-flow testing is used for both the LTC business and for all significant blocks of non-LTC business within a company. If a reserve deficiency in the LTC block is not offset with sufficiencies in the company's other blocks of business, then additional reserves shall be established as required by section 2.C.2. of *VM-30*.
 2. If cash-flow testing is not used for testing of the LTC business, then a reserve deficiency revealed from another method, e.g., a gross premium valuation, utilized for purposes of asset adequacy analysis of the LTC block under this Guideline shall not be offset with sufficiencies in the company's other blocks of business. The additional reserves under this Guideline shall be established based only upon the adequacy of the reserves in the LTC block.
- D. When determining the effect of investment returns or the time value of money:
1. In the case where cash-flow testing is used, the company must allocate investment income to the LTC block of business consistently with the way investment income generated by the General Account is managed. If, however, a segment of the General Account is used to manage the investment risk for LTC business, the investment income generated by assets from that segment should be appropriately represented within the asset adequacy analysis.

2. In the case where a gross premium valuation method is used or asset cash flows are not explicitly modeled, the discount rate used by the actuary must reflect consideration of the yield on current assets held to support the liability as well as future yields on assets purchased with future premium income and reinvestments or anticipated divestiture of existing assets.
- E. The analysis shall only anticipate premium rate increases based upon a rate increase plan that is documented, is supported by and has been approved by management, is highly likely to be undertaken, and contains rate increase requests and timelines by jurisdiction. The assumptions used in the analysis should reflect a reasonable estimate of regulatory approved amounts and implementation timelines.

5. Documentation Required

The documentation requirements below are to be incorporated as a separate section of the appointed actuary's Actuarial Memorandum required by the *VM-30* or in a special Actuarial Memorandum containing LTC-specific information and shall be submitted to the commissioner of the company's state of domicile. The separate section of the companywide Actuarial Memorandum or the special Actuarial Memorandum shall be available to other state insurance commissioners in which the company is licensed upon request to the company. The confidentiality provisions regarding the Actuarial Memorandum contained in *VM-30* are applicable to the separate section of the Actuarial Memorandum and to the special Memorandum.

- A. Results of the asset adequacy analysis of the LTC business shall be reported and documented in the separate section of the Actuarial Memorandum or the special Memorandum, as appropriate.
- B. Assumptions on mortality shall be documented to state the reference standard valuation table, if applicable, and explicitly cite adjustments, select factors, and mortality improvement factors, where applicable. If a reference standard valuation table is not used in setting the mortality assumption, then a table of rates and comparison of the applied rates to rates from an unmodified standard mortality table for sample issue ages shall be provided. A summary of experience or other actuarial support of assumptions used shall be documented.
- C. Assumptions on voluntary lapse shall be documented in table format by duration band and by other factors such as gender, marital status, with versus without inflation rider, and length of benefit period impacting the lapse assumption, where applicable. A summary of experience or other support of assumptions shall be documented.
- D. Assumptions on morbidity shall be documented and actuarial support of the assumption shall be provided. If an outside source is used as the basis for morbidity assumptions, then the rationale for the applicability of that source and any adjustments to the factors from that source shall be documented.
- E. Assumptions on investment returns and interest rates shall be documented. If a simplified approach is applied, such as implicit reflection of projected investment returns through the use of discount rates in a gross premium valuation as contemplated in Section 4.D.2., then justification shall be provided.
- F. Any rate increases already approved shall be documented by jurisdiction with approved implementation timelines. Assumptions on future rate increases shall be documented by policy form or policy grouping. Such documentation should adequately describe the way in which future rate increase assumptions are developed. Unless the appointed actuary has operational responsibility for carrying out the rate increase plan specified in Section 4.E.,

the Memorandum shall contain a signed and dated reliance statement from the person with operational responsibility for carrying out such actions that the rate increase plan(s) provided to the appointed actuary appropriately reflects management's plan.

- G. Documentation of any other material assumptions shall be provided.
- H. Documentation shall be provided for assumptions that have significantly changed from the prior year's analysis.

Actuarial Guideline LII

VARIABLE ANNUITY EARLY ADOPTION

Background

Beginning in 2015, the NAIC commissioned a study of the reserve and RBC framework for Variable Annuity products. The study concluded that the existing requirements resulted in non-economic volatility, providing incentive for companies to engage in the use of financial planning techniques that the NAIC deemed inappropriate. Considerable effort was spent to develop and test updates to the reserve and RBC framework to address these issues. That revised framework was adopted by the NAIC during 2018, and the changes to NAIC models, the NAIC *Valuation Manual*, and the NAIC *Life Risk-Based Capital Forecasting & Instructions* have been developed and adopted by the NAIC on August 2, 2019. By the provisions of the SVL (Model 820), the changes to the *Valuation Manual* will be effective on January 1, 2020, and will impact subsequent financial statements.

During the discussion of the framework by the Variable Annuities Issues (E) Working Group, the question was raised whether companies would have the option to ‘early adopt’; that is, to apply the new framework for the reserve and RBC values used for the December 31, 2019, financial statements. Since the new framework has been determined to provide improved financial measurement of the company’s liability and risk, there was agreement that optional application of the new framework for the December 31, 2019, financial statements would be appropriate.

Guideline

A company may elect to apply the VM-21 requirements from the 2020 NAIC *Valuation Manual* as the *Valuation Manual* requirements for the valuation on December 31, 2019. For such election, the phase-in provision of *Valuation Manual* VM-21 Section 2.B. may not be elected. Any company electing early adoption of VM-21 shall also:

1. Apply the provisions of *Actuarial Guideline XLIII—CARVM for Variable Annuities* as amended for 2020 to the December 31, 2019, valuation of contracts within the scope of that guideline;
2. Apply the Life RBC instructions for 2020 in the calculation of C-3 RBC in LR027 for 2019;
3. Follow the documentation and certification requirements of VM-31 from the 2020 *Valuation Manual* for the Variable Annuity Business. In the VA Summary, clearly indicate the use of the new requirements in the section on change in methods from prior year; and
4. Notify the commissioner of the state of domicile of such elections.

ACTUARIAL GUIDELINES – APPENDICES

Appendix C-1

Provides maximum reserve valuation and maximum life policy nonforfeiture interest rates for new issues, new purchases or changes in fund (as defined) under Section 4217, 4218, and 4221(k) of the New York Insurance Law as amended in 1982, 1983, 1985, 1986, 1987, 1988, 1990 and 1994. This information is provided for informational purposes and to aid compliance with the New York law.

Appendix C-2

Includes interpretations from the [former](#) Emerging Actuarial Issues (E) Working Group adopted by the Financial Condition (E) Committee. The Financial Analysis (E) Working Group [and the Valuation Analysis \(E\) Working Group](#) follows these interpretations ~~in~~[when](#) performing ~~its~~ reviews of the reserving methodologies under *Actuarial Guideline XXXVIII—The Application of the Valuation of Life Insurance Policies Model Regulation* (AG 38).

APPENDIX TO GUIDELINES

This information can be found on the New York State Department of Financial Services website:
https://www.dfs.ny.gov/apps_and_licensing/life_insurers/max_reserve_life

NEW YORK STATE DEPARTMENT OF FINANCIAL SERVICES Maximum Reserve Valuation and Maximum Life Policy Nonforfeiture Interest Rates

The maximum reserve valuation and nonforfeiture interest rates, prescribed by Sections 4217 and 4221(k) of the New York Insurance Law, are specified in "Table A through Table H Rates" noted below. Such rates vary from year to year based on Moody's corporate bond yield averages for 12 and 36 months ending on June 30, and weighting factors prescribed by Section 4217. The Moody's averages are provided for years 1981 to present in the attached Appendix.

Clarification on Fixed Annuity Reserves Interest Rates

We note that there has been some concern over the appropriate maximum valuation interest rate for flexible premium deferred annuities (FPDA). Section 4217(c)(4)(D)(iii) of the New York Insurance Law does not allow the use of the additional .05 weighting factor for annuities that guarantee interest rates on future considerations received more than twelve months beyond the valuation date. Accordingly, for flexible premium deferred annuities the weighting factors shown in Section 4217(c)(4)(D)(iii)(I) or 4217(c)(4)(D)(iii)(II) should be used. For convenience, maximum valuation interest rates for such FPDAs are shown in Table D (issue year basis) and Table G (change in fund basis). The rates shown in Table E and Table H are not appropriate for FPDAs.

September 16, 2021

TO: ALL AUTHORIZED LIFE INSURANCE COMPANIES, ACCREDITED LIFE REINSURERS, FRATERNAL BENEFIT SOCIETIES AND CHARITABLE ANNUITY SOCIETIES

SUBJECT: MAXIMUM RESERVE VALUATION AND MAXIMUM LIFE POLICY NONFORFEITURE INTEREST RATES

Attached hereto is an outline providing maximum reserve valuation and maximum life policy non-forfeiture interest rates for new issues, new purchases or changes in fund (as defined) for years 1982 through 2021 (and other years where shown), under Sections 4217, 4218 and 4221(k) of the New York Insurance Law, as amended in 1982, 1983, 1985, 1986, 1987, 1988, 1990, and 1994.

The maximum valuation and non-forfeiture interest rates, prescribed by Sections 4217 and 4221(k) of the New York Insurance Law for future years, will vary from year to year depending on Moody's corporate bond yield averages.

The maximum valuation interest rates for issues, purchases and changes-in-fund of years 1982 through 2021 (and other years where shown) are outlined below. The maximum valuation and non-forfeiture interest rates for Ordinary Life Insurance are shown in Category A of page 1, except for Single Premium Life Insurance, as defined in Section 4217(c)(4)(B)(vi), the maximum valuation interest rates for which are shown in Category B on pages 2-4.

Please refer to Sections 4217 and 4221 of NY Insurance Law, Regulation 147 and Regulation 151 for definitions and explanations of valuation interest rate, guarantee duration, plan type and product category. Regulation 151 has been effective since February 28, 2001, and is available on our web site.

This notice is to be used for informational purposes, as an aid in complying with the law.

Should any person have any question or comment in regard to this information, please contact Mr. Matthew Ryan of the Life Bureau at (518) 474-7929 or Matthew.Ryan@dfs.ny.gov.

APPENDIX

The maximum reserve valuation interest rates are based on reference interest rates, which are averages of corporate bond earnings published by Moody's Investors Service, Inc., and weighting factors prescribed by Section 4217, which defines running averages of the published monthly yield rates for 12-month and 36-month periods.

The following table shows the 12-month and 36-month yield averages for recent years:

TABLE 1

<u>For Period Ending June 30 of Year</u>	<u>12-Month Running Average</u> (1)	<u>36-Month Running Average</u> (2)	<u>Lesser of Two Averages</u> (3)
1981	13.71%	11.57%	11.57%
1982	15.70%	13.64%	13.64%
1983	13.39%	14.26%	13.39%
1984	13.22%	14.10%	13.22%

2020	3.35%	3.90%	3.35%
2021	2.96%	3.54%	2.96%

The maximum nonforfeiture interest rate for Life Insurance, under Section 4221(k), for a particular issue year, is equal to 125% of the maximum reserve valuation interest rate for the same issue year, rounded to the nearer 1/4%.

Should the computed maximum reserve valuation interest rate for Life Insurance (other than Single Premium Life Insurance covered in Category B on pages 2-4) for a particular issue year be different from the actual maximum reserve valuation interest rate for the next previous issue year by less than 1/2%, then the maximum reserve valuation interest rate for such particular issue year will be the same as that for such next previous issue year.

Appendix C-2

Interpretations of the Emerging Actuarial Issues (E) Working Group

Introduction

The former Emerging Actuarial Issues (E) Working Group (EAIWG) and the current Valuation Analysis (E) Working Group (VAWG) responds to questions of application, interpretation and clarification with respect to *Actuarial Guideline XXXVIII—The Application of the Valuation of Life Insurance Policies Model Regulation* (AG 38). Following an abbreviated public comment and review period of no less than seven days, the Working Group will adopt by consensus formal interpretations on issues presented before it. These interpretations will then be reported to the Financial Condition (E) Committee, which, after adopting, will direct the Financial Analysis (E) Working Group to follow the interpretations in performing its reviews of the reserving methodologies under AG 38. These interpretations will not become effective until formally adopted by the Financial Condition (E) Committee. In no event shall a consensus opinion of the former EAIWG~~Working Group~~ or current VAWG supersede or otherwise conflict with AG 38.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D(b)

Issue / Question

1. The Guideline does not seem to preclude a company from using the Alternative Reserve Methodology for yearend 2012, thus avoiding the Primary Reserve Methodology calculations, even if in prior valuations their total reserve held was not at least as great as the total reserve determined in accordance with the November 1, 2011 Life Actuarial (A) Task Force (LATF) statement. In other words, at yearend 2012 a company can switch to any alternative reserve methodology as long as the total reserve held is at least as great as the total reserve determined in accordance with the November 1, 2011 LATF statement using the required lapses and mortality. Is that a correct interpretation?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. Yes. The requirements as written provide for use of either 8D(a) or 8D(b) for the 12/31/12 valuation.

Interpretation of the Emerging Actuarial Issues (E) Working Group

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D(b)

Issue / Question

1. If a company uses the Alternative Reserve Methodology for yearend 2012, can they switch to the Primary Reserve Methodology for future valuations? What, if anything, should be reported in Exhibit 5A-Changes in Basis of Valuation for yearend 2012 or in future years as a result of these AG 38 revisions and any switch to the Primary Reserve Methodology or to the Alternative Reserve Methodology?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. A company, pursuant to the requirements of AG 38, 8D, may switch between the Primary Reserve Methodology and the Alternative Reserve Methodology.
3. For 12/31/12 or subsequent reserve valuations any change to or from the Primary or Alternative reserve methodologies should be reported in Exhibit 5A.
4. The company should check with their domestic state whether approval is required for any subsequent change to or from the Primary or Alternative reserve methodologies for reserves after 12/31/12.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D(b)

Issue / Question

1. The Alternative Reserve Methodology calls for deficiency reserve mortality to be based on the VM-20 deterministic reserve mortality. Since XXX calls for segments to be based on deficiency reserve mortality this could affect segment lengths. However, at least the spirit of AG46, which came out when the 2001 CSO Preferred Risk tables came out, seems to allow for segments to continue to be based on the mortality table in use when the policy was issued. Does AG46 apply here and thus the original mortality basis for the segment lengths can continue to be used?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. The original mortality basis for determining the segment length can continue to be used. 8D is not intended to be more restrictive in determination of segments.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D

Issue / Question

1. Subsection 8Da states that the Primary Reserve is determined by adding any excess of (2) over (1), where (1) is the reserve according to the methodology and assumptions used to calculate the reserves reported as of December 31, 2011. In the following three scenarios, what is the basis for the determination of (1)? Assume that scenarios 1 and 2 involve universal life with secondary guarantees (ULSG) policies issued between July 1, 2005 and December 31, 2006, with a higher set of cost of insurance (COI) charges being triggered if the shadow account value ever becomes 0 after issue:

- a. Issue 1) Reserves have always been calculated using the wrong methodology for determining the ratio in the fourth step of Section 8B. In applying Section 8D, would the reserves for 8Da1 be based on the correct methodology or on the methodology actually used by the company for year-end 2011?
- b. Issue 2) A policy has a negative account value but has not lapsed due to the secondary guarantee. The shadow account value eventually drops to 0 and then becomes negative, and the policyholder pays a premium during the grace period intended on keeping the policy in force. The company invokes the higher secondary guarantee charges to calculate the shadow account value, but the policyholder argues that the lower shadow account COI charges apply due to the premium being paid during the state required grace period; i.e. that during the grace period the policyholder has the opportunity to pay a premium based on the lower COI charges rather than based on the much higher set of COI charges. This is litigated, and a ruling is made that the higher COI rates cannot be charged unless the shadow account value has not been positive for a period of time greater than the grace period. Based on this ruling, the assumption in the AG38 calculation that the higher set of COI charges would be triggered at the end of the first policy year would not be valid. Would the reserves for 8Da1 continue to be based on the assumption that the higher COI charges would be triggered after the first policy year, or would they be modified to reflect the lower COI charges?
- c. Issue 3) Policies with multiple sets of COI charges have only been issued in 2012. What is the basis for the value of (1)?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. Issue 1) The reserves determined by the company under 8D(a)(1) are intended to be consistent with the methodology used by the company for the 12/31/2011 valuation. If a calculation error has been made in applying the 2011 methodology, this error should not be repeated in applying this methodology for the 2012 year-end valuation.

3. Issue 2) Where a valid court decision has interpreted the provisions of a policy, those interpretations should be reflected in future reserve calculations. In effect, the court ruled that the company made a mistake in applying certain policy provisions. Therefore, the 2012 reserve calculations should incorporate the correct view of the affected policies' provisions as determined by the court. As in 1) above, any error in the 2011 reserve calculations due to this company mistake should not be perpetuated in the 2012 reserve calculations.

4. Issue 3) In this case, the value of (1) would be based on the company's methodology for reserving these policies for 2012 quarterly reporting.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation

Issue / Question

1. My question is on section 8E, regarding when a product would fall under method 1 or method 2. If you have a shadow account product that has either a single set of charges, or multiple sets of charges, and the product meets the crediting rate limitations defined in method 1, is there anything that could cause the product to be deemed to be subject to method 2? To put it another way, when I read section 8E, it seems that any shadow account product meeting the interest crediting limits would fall under method 1. This is because all shadow accounts have either a single set of charges or multiple sets of charges, so all shadow account products that meet the interest crediting limitation would fall under policy design 1 or policy design 3. Is this a correct interpretation, or if not, why?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. This interpretation is not completely correct. In drafting the revisions to AG 38, regulators were aware of the possibility that all existing and future product designs might not fit the three generic product designs noted in AG 38, independent of the crediting rate limitation. Method II was intended to provide a default reserve methodology for these other product designs, together with the more generic product designs containing interest crediting guarantees higher than the company-selected interest index plus 3 percent. The considerations in satisfying the actuarial opinion requirements contained in Section 8E should enable the opining actuary to determine the appropriate reserving methodology for a particular universal life with secondary guarantees (ULSG) product design.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D(b)

Issue / Question

1. Section 8D(b), Alternate Methodology, requires the company to determine its deficiency reserve under Model 830 using mortality and lapse assumptions according to the same requirements for determining the deterministic reserve in the Valuation Manual. Does this require the company to determine its Triple-X segments (under the segmentation method) using the q_x and lapse rates of the VM, or simply use these q_x and lapse rates in calculating the deficiency reserve once the segments are determined using the company's current approach for determining such segments?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. The original mortality basis for determining the segment length can continue to be used. 8D is not intended to be more restrictive in determination of segments.

Note: This response is similar to that for question Actuarial INT 03.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation

Issue / Question

1. Given all of the focus that the Guideline places on what premiums to use for these universal life with secondary guarantees (ULSG) reserve calculations, we are having unexpected difficulty finding published guidance on what premiums to assume in the deterministic reserve calculations for the Primary Reserve Methodology. Does such guidance exist and if so, where can we find it?
2. This question specifically asks for published guidance, but if none exists, perhaps the Working Group could provide such guidance or at least common practices/approaches they are aware of. Guidance is needed to create consistency amongst how companies are approaching this step of the calculation.

Interpretation of Emerging Actuarial Issues (E) Working Group

3. For 8D(a)(2) reserve calculations, the company should use the expected premium to be paid by the policyholder, determined either policy-by-policy or by appropriate policy groupings. The Valuation Manual adopted by the A Committee on 8/17/12 provides requirements regarding premiums for the deterministic reserve calculation. Such requirements include those in Section 4(A), Section 7(B), and Sections 9(A) and 9(D).

Interpretation of the Emerging Actuarial Issues (E) Working Group

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8E(II)

Issue / Question

1. For the combination premium patterns, what does it mean "...to have access to better charges and credits..."? Can this be ignored if the product only has one set of charges?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. Better charges and credits can be understood as lower charges and/or higher credits that may be triggered based on the magnitude of the premium paid, the shadow account or other measures generally dependent on policyholder behavior. For example, a higher interest rate might apply to amounts above or below some defined premium dollar limit in particular policy years or based simply on the level of the shadow account. Higher or lower premium payments could lead directly to the most favorable interest rate (or weighted average interest rate) accessible within product design constraints. Better charges and credits would generally lead to lower minimum gross premiums and potentially greater deficiency reserves. For purposes of this question this requirement cannot be ignored, particularly if there are multiple sets of credits in addition to the assumed single set of charges.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D (a)(2a)

Issue / Question

1. Should the VM-20 deterministic reserve starting asset requirement related to the 2% collar be applied before or after the Primary Reserve Methodology caps on starting and reinvestment assets are applied?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. Subsection a.2.a) (I) of Section 8D requires the determination of one of two portfolios of existing assets to support the initial reserve estimate for the block. Once this initial asset portfolio is determined, the deterministic gross premium reserve is determined using as the discount rates the net investment returns generated by the future projected cash flows calculated using the selected initial portfolio and future net reinvestment rates established according to subsection a.2.a) (II) of Section 8D.

3. If the resulting reserve falls within the +/- 2% collar (referenced in VM-20) relative to the initial reserve estimate (and corresponding level of initial assets), the calculated reserve is the final reserve. If the calculated reserve breaches the +/- 2% collar, the actuary must either provide a detailed rationale as to why the calculated reserve is appropriate or redo the reserve calculation assuming revised initial reserve and asset levels.

4. In performing the additional reserve calculation(s), use the same asset portfolio (adjusted upward or downward as below based on the results of the deterministic reserve calculation), either that of subsection a.2.a) (I) (i) or a.2.a) (I) (ii), as chosen for the initial reserve calculation.

5. If the initial or subsequently determined reserve is greater than the prior reserve estimate and the asset portfolio used in the deterministic reserve calculation is:

- a. as described in subsection a.2.a)(I)(i), then the prior asset portfolio shall be adjusted upward using assets as described in subsection a.2.a)(I)(i) to the extent such assets remain available in the company's portfolio after which such assets shall be adjusted upward as needed using assets as described in subsection a.2.a)(I)(ii). The recommended method for adjusting the prior asset portfolio upward is to do so in a pro rata fashion. Any other method proposed for adjusting the prior asset portfolio upward must be clearly documented in the Actuarial Memorandum and shall not involve changing the asset composition of the prior asset portfolio but shall constitute only additions to that portfolio.

Appendix C-2

- b. as described in subsection a.2.a)(I)(ii), then the prior asset portfolio shall be adjusted upward as needed in a pro rata fashion using assets as described in subsection a.2.a)(I)(ii).

6. Regardless of which portfolio is chosen for the initial deterministic reserve calculation, if the initial or subsequently determined, reserve is less than the prior reserve estimate, then the prior asset portfolio shall be adjusted downward as needed in a pro rata fashion.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8E/8D

Issue / Question

1. Consider the following: A universal life policy with a secondary guarantee requires that a shadow account be maintained at a positive level for the secondary guarantee to remain in effect. Once the shadow account value goes down to zero, the secondary guarantee terminates and cannot be reactivated. There is only one set of charges and credits that apply to the shadow account. In determining reserves for this policy under section 8E, would the assumption be made that the secondary guarantee terminates at the end of the first policy year since, if only the minimum premium is paid, the shadow account value would be zero at the end of the first policy year?
2. If the policy was written before 2012, would it be subject to section 8D?

Interpretation of Emerging Actuarial Issues (E) Working Group

3. For issues in or after January 1, 2013, 8E would be applicable. But the policy, as described, would not fit into Method I because the minimum premium derived according to Method I would not satisfy the secondary guarantee requirements. Calculation of the reserve using Method I requires that the minimum premium keep the secondary guarantee in effect. Therefore, it must be reserved according to Method II.
4. For issues between July 1, 2005 and December 31, 2012 (inclusive), any regulatory response regarding applicability of Section 8D would require analysis of the policy form and dialog with the valuation actuary.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8E

Issue / Question

1. Under 8E, Method I, Policy Design #1 applies for policies containing a secondary guarantee that uses a shadow account with a single set of charges and credits. For those policies, the minimum gross premium for any policy year is the premium that, when paid into a policy with a zero shadow account value at the beginning of the policy year, produces a zero shadow account value at the end of the policy year, using the guaranteed shadow account charges and credits specified under the secondary guarantee. Presumably, this will result in a yearly renewable term (YRT)-like pattern for the minimum premium.
2. The actuarial opinion required by 8E includes the statement "the minimum gross premiums determined under Policy Design # ___ are not inconsistent with the minimum premiums, charges and credits that are expected to apply under the policy." What is meant by "expected to apply"?
3. Since it is not likely that the policyholder will fund the policy using the YRT-like pattern that is the minimum premium, it does not seem as if "expected to apply" means "expected to be paid." It appears that "expected to apply" should be interpreted to mean that the YRT-type pattern will either fund the secondary guarantee or it is less than the minimum amount necessary to fund the guarantee.

Interpretation of Emerging Actuarial Issues (E) Working Group

4. The phrase "expected to apply" is intended to mean that the minimum premiums determined (\$0-to-\$0) are based on charges/credits generally consistent with those expected to apply to premium scales likely to be received from policyholders. For example, high premium loads at later durations would not be expected to apply for products with charges and credits that encourage a limited-pay or single-pay premium pattern. Other design features that should give the opining actuary pause, and could draw regulatory scrutiny, include negative charges and credits or unusual patterns of charges and credits. In addition, the actuary should not favorably opine on a product for Method I reserves with variables resulting in minimum gross premiums that would be inconsistent with the premiums a reasonable person would pay to limit advance funding. If the actuary is unable to opine favorably, the reserves should be calculated under Method II.

Issue / Question

1. A shadow account has a product design feature where the premium load is expressed as a fixed percentage of premium up to the target premium, and the target premium is reasonably consistent with level premium funding of the lifetime guarantee. In effect, there is a fixed dollar cap on the annual premium charge. The literal form of the charge is simply a specified percentage of premiums up the target premium and 0% thereafter. This will always mathematically produce the same result as the capped charge described above. Please clarify that a fixed dollar cap for the premium load, regardless of how the cap is expressed, does not make such a product incompatible with Policy Design # 1.

Interpretation of Emerging Actuarial Issues (E) Working Group

2. A flat percentage of premium charge, subject to an annual maximum, would be compatible with Policy Design (PD) #1 provided the actuary is able to issue an unqualified actuarial opinion. The specified percentage rate subject to an annual maximum may be construed as a single rate even though an alternative expression of this charge could be viewed as involving a second rate equal to zero. However, it should be noted that the actuary might be unable to opine favorably in the case of designs with credit/charge structures that encourage limited-pay premium schedules.

3. The above interpretation does not extend to designs using a flat percentage load for premiums up to a break point and a different (non 0%) load for premiums above that. Such a design should be considered as PD#3, as would any design with tiered interest rate credits or other tiered credits/charges.

Issue / Question

1. Does the exemption for UL policies with short guarantee periods (see below) still apply in Section 8E of AG38?
2. This language is from the XXX model reg (Model 830)
 - 3.A.(2) This regulation shall not apply to any universal life policy that meets all the following requirements:
 - (a) Secondary guarantee period, if any, is five (5) years or less;
 - (b) Specified premium for the secondary guarantee period is not less than the net level reserve premium for the secondary guarantee period based on the CSO valuation tables as defined in Section 4F and the applicable valuation interest rate; and
 - (c) The initial surrender charge is not less than 100 percent of the first year annualized specified premium for the secondary guarantee period.

Interpretation of Emerging Actuarial Issues (E) Working Group

3. Yes.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D

Issue / Question

1. Section 8D(a) references the deterministic reserve calculation in the VM20 valuation manual in the definition of the Primary Reserve Methodology. As part of the asset assumptions used in the deterministic reserve calculation, page 82 of the VM20 manual describes the derivation of the Illustrative Current Market Benchmark Spreads. We have reviewed the JP Morgan US Liquid Index data referenced, and the final published values appear to be derived from the underlying data for the index as opposed to referencing published table views. Does the Working Group agree that using an updated table would be preferred? Would the Working Group consider publishing an updated table as of 9/30 or providing additional details on how the table values (shown on page 89) were derived? The values for Table G (page 90) for the below investment grade bonds were taken directly from the source index so they are easy to replicate.

Interpretation of Emerging Actuarial Issues (E) Working Group

2. For the 12/31/12 AG 38, 8D valuation it may be assumed that the 9/30/09 Tables H & I approximate both Tables F & G and Tables H & I as of 12/31/12. This assumption is based on benchmarking with current spread information from other sources as of 12/31/12. It is understood that strict technical compliance for each and every asset may not be possible due to modeling limitations. Professional judgment should be used to produce results that comply with the spirit of this standard, i.e., no lessening of conservatism. For example, if a company has access to current data sources and can reconstruct Tables F and G as of 12/31/12 then this would be an acceptable approach. In any event, appropriate explanation and justification should be provided for the methodology that was employed and the results that were obtained. The NAIC intends to provide updated tables for future year end AG 38, 8D, valuations.

Issue / Question

1. If the modified VM-20 deterministic reserve ends up being the minimum reserve held in the AG 38 8D calculation, can a reinsurance reserve credit also be calculated under the guidance of VM-20 (in particular for YRT reinsurance)?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. The Section 8D reserve methodology (VM-20 deterministic) applies for calculating the company's aggregate gross reserve before reinsurance. AG 38, 8D, does not address how the credit for reinsurance is determined. The approach to determine the credit for YRT reinsurance shall be documented in the stand-alone Actuarial Memorandum required by AG 38, Section 8D(c).

Issue / Question

1. A product has a shadow account product design feature where, in addition to the fixed charges and credits associated with the policy, there is a shadow account premium charge in the event that the policyholder underfunds the policy. This premium charge is expressed as a fixed percentage of the premium shortfall when compared to a given level premium.
2. Please clarify whether a shadow account charge expressed as a fixed percentage of the premium shortfall is regarded as “multiple sets of charges” or as a “single set of charges” and thus whether such a product is compatible with Policy Design # 1 or Policy Design # 3.

Interpretation of Emerging Actuarial Issues (E) Working Group

3. This charge and treatment as Policy Design 1 does not appear consistent with the type of charge and treatment addressed by adopted INT 24 (formerly referred to as Pending Submission 6 prior to its adoption).
4. INT 24 deals with a single charge that all policyholders will incur which stops after a certain level of premiums have been paid. The charge described here is not incurred by all policyholders and provides the potential for a reserve premium being subject to the full impact of this charge whereas the premiums actually expected to be paid would not incur this charge.
5. More information is needed to fully assess the applicable Policy Design but based on the information provided Policy Design 3 appears appropriate.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8E I) 3 Actuarial Opinion and Company Representation section

Issue / Question

1. A company currently issues a ULSG product that is clearly a Policy Design #3. Two hypothetical examples of the charge/credit structure are shown in Tables 1 and 2 below. Under either structure, the policy form:

- Is clearly Policy Design #3
- Does not run afoul of the “Index plus 3%” of 8E

2. The purpose of the bifurcated cost of insurance charge structure in Table 1 or bifurcated premium charge structure in Table 2 is to optimize management of policyholder premium paying pattern behavior. The exact insurance charge for any given policy under the Table 1 design is either COI 1 or COI 2, where the rate is determined by comparing the actual fund value to a pre-defined fund value. If the actual fund value is in excess of the pre-defined fund value, COI 1 is used, otherwise COI 2 is used. Similarly, the exact premium charge amount for any given policy under the Table 2 design is PremPct1 for amounts paid up to a target amount plus PremPct2 for amounts paid in excess of the target amount.

3. The company’s approach to establishing statutory reserves has always been to determine AG XXXVIII Step 1 minimum premiums based on the lowest charges from Table 1 (or Table 2). The actuary concludes that everything in the reserving practices of the company with respect to this policy form is in compliance with the letter and spirit of AG XXXVIII, and except for the third statement in the Actuarial Opinion (of Section E), the actuary feels s/he could sign such an attestation. The third statement declares “the minimum gross premiums determined under Policy Design #3 are not inconsistent with the minimum premiums, charges and credits that are expected to apply”.

4. What is the actuary expected to do in such a situation?

TABLE 1					TABLE 2				
	COI_1	COI_2	Interest	Prem Load		COI	Interest	Up to Target PremPct1	In excess PremPct2

Regulation XXX; *Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation*, Section 8D

Issue / Question

1. The company states that reserves equal to the deterministic reserve required in the valuation manual of the valuation law (model 820) are lower than produced under the above methodology, but states that it would hold reserves per the valuation manual if that produced greater reserves in aggregate for the block. If tested for each policy, the reserve required per the valuation manual would in some cases be higher than as calculated based on regulation XXX. Can the valuation manual floor be applied in aggregate rather than for each policy?

Interpretation of Emerging Actuarial Issues (E) Working Group

2. The deterministic reserve as required by Actuarial Guideline 38 8D(a) should be applied in the aggregate versus policy by policy.

Not for Distribution

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 7 and Steps 1, 2, and 8 of Section 8E

Issue / Question

1. Does the language “This result may be negative.” occurring twice in Step 3 of Section 8E of Actuarial Guideline 38 (AG 38) apply only to the Method II reserve approach in AG 38 or to both Method I and Method II reserve approaches? Step 3 of Section 8E of AG 38 provides for the determination of the amount of actual premium payments (or shadow account) greater than or less than the minimum gross premiums (or shadow account based on minimum premiums), as defined in Section 8E.
2. The issue regarding the referenced language relates to the interpretation of Step 3 as it applies particularly to (i) cumulative premium secondary guarantee designs with a “premium catch-up provision” or (ii) shadow account secondary guarantee designs where, if the shadow account is below the level necessary to maintain the secondary guarantee, there is a “catch-up provision” where the shadow account may be reinstated prior to the end of the secondary guarantee period.
3. In addition to Section 8E of AG 38, it appears that Section 7 of AG 38 applies in this situation. For Section 8E Method I reserve calculations, the language of Section 7 appears to deal with any deficiency indicated in Step 3 of Section 8E satisfactorily since that deficiency is measured relative to the guarantees (cumulative premium or shadow account). In this case, the value of the numerator in Step 3 of Section 8E would be zero and the floor basic and deficiency reserve would be set at the minimums defined in Section 7.
4. However, for Section 8E Method II reserve calculations, for purposes of applying Section 8E, the deficiency in Step 3 is measured relative to the premium defined in Step 1 which is the schedule of minimum gross premiums that create the greatest deficiency reserve rather than the schedule of minimum gross premiums based on the policy guarantees. This is inconsistent with the requirements and intent of Section 7 and therefore would allow for the ratio in Step 4 of Section 8E to be negative.

Interpretation of Emerging Actuarial Issues (E) Working Group

5. The recommended response is essentially correct. The phrase, “This result may be negative” applies only to Method II policies in Section 8E, Step 3. This phrase does not apply to the Step 3 amount for Method I policies given the requirements of AG 38, Section 7. Method I policies that would otherwise have a negative Step 3 amount were it not for Section 7 are those policies that are underfunded but provide for a catch up provision as addressed by Section 7. The Step 2 basic and deficiency reserves for such policies, used to calculate the “reserve floor” in Step 8 (c), must be adjusted as provided by Section 7 prior to calculating the “reserve floor” in Step 8 (c).

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D.a.2(a)

Issue / Question

1. Section 8D directs companies to use “...the same requirements for determining the deterministic reserve in the version of the valuation manual specified...but with two modifications...” In determining future Treasury yield rates used in calculating the sale price of any asset existing on the valuation date, this language in Section 8D of AG38 can be interpreted in one of two ways:

- a. Assuming a level series of future Treasury yield curves for all future years of the model projection period. In this case, any gains or losses arising from the sale of existing assets during the projection period would be determined using a level Treasury yield curve scenario prospectively, and a spread applicable to the asset, as determined on the valuation date.
- b. Assuming the series of future Treasury yield curves is that described under Scenario 12 from the prescribed set of interest rate scenarios used in the stochastic exclusion test in VM-20. To these Treasury rates is added a spread to determine the yield rate to be used on the sale of an existing asset during the model projection period.

Interpretation of Emerging Actuarial Issues (E) Working Group

2. It is recommended that the approach outlined in paragraph 1.a. be the interpretation of the relevant language of Actuarial Guideline 38 Section 8D.a.2(a).

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D.A.2(a)(I)

Issue / Question

1. Section 8.D.A.2(a)(I) states, “net investment returns based on a portfolio of A-rated corporate bonds purchased in the year of issue of the policies based on yields available in the year of issue of those bonds” shall be calculated.
2. A possible interpretation of this language is that a company may be permitted to determine this hypothetical portfolio book yield for each year using their actual A-rated bonds purchased in that year, i.e. their own A-rated bonds. Is this approach acceptable?

Interpretation of Emerging Actuarial Issues (E) Working Group

3. It was the intent of this provision that a company use a hypothetical portfolio composed of A-rated corporate bonds with yields commensurate with the A-rated corporate bond yields available in the year of issue. If the yields associated with the company's actual A-rated bonds purchased in the year of issue are commensurate with A-rated corporate bond yields available in the year of issue, then the company's approach is acceptable. If the yields associated with the company's bonds are significantly higher than A-rated corporate bond yields available in the year of issue, then the approach is unacceptable.
4. If such an approach was used, the appointed actuary should address this question in the memorandum. Reasonable approaches for comparison to a company's assets include using a published index of A-rated corporate bond yields such as Moody's at an appropriate point in the year of issue or an average over the course of the year. Another reasonable approach would be to use a Treasury yield curve at an appropriate point in the year of issue or an average over the course of the year plus an appropriate published spread of A-rated corporate bond yields over Treasuries. An appropriate point in time would be June 30 of that year if the business was sold uniformly throughout the year. If the comparison does not show the yields from company's assets to be commensurate with the published index or adjusted yield curve rate, then (a) the sample size of the company's own A-rated portfolio relative to the total portfolio backing the liabilities, and (b) the year to year consistency of asset allocation become major items to be addressed in the memorandum.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D.a

Issue / Question

1. Section 8D.a. applies to a company's aggregate gross reserve before reinsurance. The reserve calculation requires a projection of future year-by-year cash flows, which includes such items as investment earnings and general insurance expenses. If a company has ceded 100% of the business to an authorized reinsurer by use of coinsurance, the assets and net liabilities are no longer on the ceding company's books. Additionally, the administration is also generally transferred to the reinsurer. In such circumstances, the projection of future cash flows is "hypothetical" in that one must assume a starting asset portfolio, future investment strategy, future general insurance expenses, and so on. Furthermore, the ceding company generally does not have the data or systems to determine the reserves and must rely on the assuming company.

2. Since the assuming company is required to calculate the reserves on both direct and assumed business, may the ceding company use the reserves as reported by the reinsurer in the reinsurer's annual statement?

Interpretation of Emerging Actuarial Issues (E) Working Group

3. Under 100% coinsurance agreements with an authorized reinsurer, the ceding company is permitted to report reserves equal to those calculated by the reinsurer in the reinsurer's Exhibit 5/Schedule S.

4. Note that this interpretation was not being requested for coinsurance with funds withheld, modified coinsurance, or agreements where the reinsurer is unauthorized.

5. The Working Group recommends the above interpretation as guidance for yearend 2013, provided there is no conflict with the accounting requirements in the *Accounting Practices and Procedures Manual*. The issue/question will be submitted to the Life Actuarial (A) Task Force for broader consideration and possible amendment to the valuation manual.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Sections 8B and 8C

Issue / Question

1. Step 4 of Section 8E says "...determine the minimum amount of shadow account required to fully fund the guarantee." Should this determination take into account actual history, or is this a purely theoretical value?
2. Consider a hypothetical policy valued on its 5th anniversary. It has a shadow fund value of \$12,000. Premiums of \$2,500 were paid on each anniversary. If the policyholder paid an additional \$63,000 (net of premium loads) on the valuation date, the guarantee would be fully funded. However, due to the product design, if the \$12,000 shadow fund value resulted from a single premium of \$10,000 at issue, the guarantee would be fully funded by payment of an additional \$60,000 (net) at the valuation date. Is the "minimum amount" \$75,000 or \$72,000?

Interpretation of Emerging Actuarial Issues (E) Working Group

3. Step 4 of Section 8E states that the determination is to be made as of "the valuation date for the policy being valued...", indicative of a seriatim calculation that considers the actual circumstances of the policy. If on the valuation date a specific set of charges and credits are applicable for future shadow account calculations, such charges and credits should be used in the determination regardless of any more favorable charges and credits that may have been available as of the issue date.
4. Given the information that the policyholder has no control over the future charges and credits to be applied in fully funding the guarantee, it is presumed that a single set of charges/credits (with no caps or floors) is operative as of the valuation date. While an unqualified response is not possible in the absence of a full understanding of the policy design, the minimum amount appears to be \$75,000 rather than \$72,000.
5. Also, per AG38, Section 8E, the actuary must ensure that the methodology is compatible with the intent that the funding ratio (Step 3 result divided by the Step 4 result) measures the level of prefunding.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D

Issue / Question

1. Actuarial INT 27 clarifies that AG38, Section 8D, addresses the gross reserve requirements and required documentation regarding reinsurance. In reviewing the AG 38, Section 8D Actuarial Memorandum and reinsurance information, it appears that guidance is needed to address situations where the YRT reinsurance agreement reserve credit taken may be significantly different than the reserve an assuming company has set up. Such a significant difference can be due to a larger credit being calculated under VM-20 assumptions versus that set up by an assuming company. Additionally, in some cases the higher gross reserve required under the AG 38, Section 8D modified deterministic reserve, was not reported in the statutory blank prior to the reinsurance credit being taken.

Interpretation of Emerging Actuarial Issues (E) Working Group

2. The reserve established pursuant to AG 38, Section 8D (AG38-8D), should be reported on a gross basis prior to any adjustment for reinsurance. In addition, the reserve credit for reinsurance on policies subject to AG38-8D should be calculated using current statutory requirements and mortality and interest applicable under the AG38-8D.a.1. calculation.

3. Since AG38-8D does not address credit for reinsurance and only addresses calculation of the gross reserve, any determination of such credit would be outside of AG38-8D and, therefore, based on current statutory requirements and accepted practices. For example, for the calculation of the ceding credit to be posted in the statutory statement, current accounting guidance (including SSAP No. 61R, paragraph 37) should be followed. And for asset adequacy analysis, both for general testing of aggregate reserves and for the standalone analysis required by AG38-8C, currently accepted actuarial practice should be followed. AG38-8D does not incorporate VM-20 directly into either of these.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D. a.2.a)(I), Section 7.D. of VM-20

Issue / Question

1. Subsection a.2. of Section 8D provides for two exceptions to the usual deterministic reserve requirements of VM-20 in calculating the gross premium reserve in Section 8D.a.2. One of these exceptions, in subsection a.2.a)(I), relates to net investment earnings on starting assets and limits those earnings to "...the lesser of (i) the actual portfolio net investment returns and (ii) the net investment returns based on a portfolio of A-rated corporate bonds..."

2. The language of Section 8D.a.2.a)(I) is not prescriptive as to the process for determining this net investment earnings comparison. One option is to compare actual portfolio yields to hypothetical portfolio yields as of a single point in time, most logically the valuation date. Another option is to develop both an actual and hypothetical portfolio as of the valuation date and project future asset cash flows and net investment returns prospectively and then use the lesser earning portfolio net investment return in each future year. Other prospective-type approaches to determining the Section 8D.a.2.a)(I) lesser net investment return portfolio are also possible. These lesser returns are then combined, in some fashion, with the net reinvestment return prescribed in Section 8D.a.2.a)(II) to develop the final path of discount rates used in the final Section 8D.a.2.c) reserve calculation.

3. In determining an appropriate interpretation of the language of Section 8D.a.2.a)(I) an important question to ask is: Is a prospective-type interpretation and approach illustrated above, or something similar, consistent with the determination of a single starting asset portfolio as described in Section 7.D. of VM-20? The objective of the requirement in Section 8D.a.2.a)(I) is to impose a restriction on the determination of the starting asset portfolio required under VM-20 for the deterministic reserve calculation, not to anticipate the use of multiple portfolios prospectively. The use of future year-by-year net investment returns from multiple portfolios (actual and hypothetical) would appear to be inconsistent with the starting asset portfolio requirement of VM-20.

4. The issues at hand are twofold:

- a. Does a prospective future net investment return comparison interpretation of the language of Section 8D.a.2.a)(I) create an inconsistency with the language of Section 7.D. of VM-20 with respect to the requirements for utilizing a single starting asset portfolio in the deterministic reserve calculation?
- b. Given the multitude of possible approaches that might be used, does a prospective future net investment return comparison interpretation of the language of Section 8D.a.2.a)(I)

lead to the creation of a non-level playing field beyond the range of approaches available in interpreting Section 8D.a.2.a)(I) in a manner that is consistent with VM-20?

Interpretation of Emerging Actuarial Issues (E) Working Group

5. For 12/31/2014 and later Section 8D submissions, for purposes of determining the starting asset portfolio, the language of Section 8D.a.2.a)(I) is interpreted such that the actual/hypothetical starting asset portfolio net investment return comparison is made as of the valuation date and not prospectively. Examples of how the comparison may be made include (i) a comparison of the weighted average hypothetical portfolio versus actual portfolio net investment returns as of the valuation date or (ii) a historical issue-year-by-issue-year hypothetical versus actual portfolio net investment return comparison, perhaps resulting in a starting asset portfolio as of the valuation date that is a hybrid of the company's actual portfolio assets for certain issue years and a hypothetical asset portfolio for other issue years.

6. For purposes of this comparison for 12/31/16 and later, the actual portfolio net investment return is adjusted by the current amortization of IMR allocated to the portfolio. This adjustment is made only for the comparison of portfolio yields to determine the appropriate portfolio to use in the development of the deterministic reserve. The reserve amount is then determined following the procedure defined in VM-20.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D.a.2.c) and Section 7.C.4. of VM-20

Issue / Question

1. Subsection a.2.c) of Section 8D provides for the calculation of gross premium Primary Reserve to be performed using the path of net investment returns determined in Section 8D.a.2.b) "...to discount the cash flows applicable to those policies.", i.e. those policies subject to Section 8D. The cash flows referenced in Section 8D.a.2.c) are to include, as per Section 4.A.3. of VM-20, death and cash surrender benefits. For the ULSG policy types subject to the requirements of Section 8D, if the interest rate credited to the policy account value is a non-guaranteed element (NGE), the value of the benefits be directly impacted by the net investment earnings of the assets used to back the reserves held in support of the risks assumed under the policies. In addition, lapse rates for these ULSG policy types also may vary depending on the net investment earnings of the assets used to back the reserves held in support of the risks assumed under the policies.
2. Section 7.C. of VM-20, covering NGE cash flows, requires, in subsection 4. that:
 - a. "Projected levels of NGE in the cash flow model must be consistent with the experience assumptions used in each scenario. Policyholder behavior assumptions in the model must be consistent with the NGE assumed in the model."
 - b. There is only a single (level) interest rate scenario applicable for the Section 8D.a.2. reserve gross premium reserve calculation so the issue centers on whether the NGE and policyholder behavior assumptions are "consistent" with the experience assumptions and NGE respectively.

Interpretation of Emerging Actuarial Issues (E) Working Group

3. This interpretation permits the delinking of the liability cash flows used in the Section 8D.a.2.c) gross premium reserve calculation from the net investment returns determined as in Section 8D.a.2.b) provided the actuary can provide justification that the impact of such delinkage on the Section 8D.a.2. reserve calculation is consistent with the requirements of Section 7.C.4 and Section 2G of VM-20.
4. The information required to support the delinked approach would need to present reasonable justification and reflect the consistency of the assumptions used with the particular company's anticipated experience and ULSG product structures. The information provided should be adequate to support the assertion that the requirements of Section 2.G. and Section 7.C.4. of VM-20 have been achieved.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8D. a.2.a)(I)

Issue / Question

1. Section 8D directs companies to test: “The company’s aggregate gross reserve before reinsurance for the business subject to this Section 8D to be reported in the December 31, 2012, and subsequent annual statutory financial statements of the company will be the aggregate reserve under 1 below, plus any excess of the aggregate reserve determined as defined in 2 below, over 1”.
2. Furthermore Section 8D requires that for existing assets: “The projected net investment earnings from the starting assets shall be the lesser of (i) the actual portfolio net investment returns and (ii) net investment returns based on a portfolio of A-rated corporate bonds purchased in the year of issue of the policies based on yields available in the year of issue for those bonds.”
3. Is it required to test reinsurance assumed?
 - a. Some companies only test at the direct writer level (using hypothetical portfolios) while other companies test the reinsurance assumed against actual assets.
4. Is it appropriate to use hypothetical portfolios for testing?
 - a. Assuming a company where the reserves are 100% ceded (all but an insignificant amount was coinsurance) and no assets remain. May the company test on the basis of a hypothetical portfolio of A rated bonds described above? While this may be the only interpretation available, there is no connection between the assets and the liabilities or any company investment policy.
 - b. When the existing asset yield is below that of the hypothetical portfolio, is it required to take a hair-cut on the yields of the existing assets or is it acceptable to use a hypothetical portfolio of just one bond per issue year instead?

Interpretation of Emerging Actuarial Issues (E) Working Group

5. Do the requirements of AG38-8D apply to applicable reinsurance assumed?
 - a. Yes. It is required to apply the requirements of AG38-8D to include reinsurance assumed on risks that are within its scope. AG38-8D(a) includes the company’s “aggregate gross reserve before reinsurance...”. This is interpreted, for applicable business, to be the company’s direct written business plus coinsurance reinsurance assumed and prior to any

reinsurance ceded. Only this interpretation is consistent with the scope of AG38-8D and the reporting of reserves in Exhibit 5 of the annual statement.

6. Is it appropriate to use hypothetical portfolios for testing?
 - a. There are two types of hypothetical portfolios possible for this question.
 - i. The first type of hypothetical portfolio is required by AG-38, 8D(a)(2)(a)(I)(ii). This citation provides for a derivation of a hypothetical “portfolio of A rated corporate bonds purchased in the year of issue of the policies based on yields available in the year of issue for those bonds.”
 - ii. There may be a second type of hypothetical portfolio to use in place of the actual portfolio pursuant to AG38, 8D(a)(2)(a)(I)(i) if that actual portfolio is incomplete or unavailable for a company that has ceded some or all of the risk through coinsurance. In this case the company may coordinate with and make use of the reserve calculations of the assuming reinsurer, as provided in VM-20 Section 8.A.1. However, the ceding company, in calculating the pre-reinsurance ceded reserve or gross reserve required by AG-38 Section 8D, must assure that such modeling and assumptions are appropriate as provided by the first paragraph of VM-20 Section 8.D.2 and as provided by VM-20 Section 8.D.2.b.

Actuarial Guideline 38—The Application of the Valuation of Life Insurance Policies Model Regulation, Section 8E

Issue / Question

1. A universal life policy contains a secondary guarantee based on the value of a shadow account. As long as the shadow account is positive, the policy is guaranteed not to lapse, even if the cash surrender value is not positive. The shadow account value accumulates with interest from one period to another, with deductions for COI charges. The interest credited to the shadow account is calculated as follows:

- 10% interest is credited to the shadow account up to a threshold amount.
- 0% interest is credited to the any excess of the shadow account over the threshold amount.
- The threshold amount is equal to the accumulation of the level premium that would keep the shadow account positive throughout the secondary guarantee period, assuming 10% interest is credited.

2. The shadow account is not larger than the threshold amount on the valuation date. For purposes of the fourth step in sections 8B and 8C of the Guideline, what interest rate should be used to determine the shadow account value that would fully fund the secondary guarantee?

Interpretation of Emerging Actuarial Issues (E) Working Group

3. This interpretation is qualified for issues within the scope of AG 38, Section 8E, only and applies to those section 8E products issued on and after 1/1/16. The intent of the ratio in AG 38 8E Step 4 is to measure the level of pre-funding and to specify its use to establish reserves in its application to the Net Single Premium. The objective is to provide for reserves equal to the appropriate portion of the Net Single Premium represented by pre-funding as of the valuation date. The ratio is a practical convention for this objective.

4. For shadow account secondary guarantee product designs with multiple charges/multiple credits where consistency of charges and credits in the numerator and denominator of the ratio is difficult to achieve, reasonable efforts must be made to establish a ratio which, on an aggregate basis, carries out the objective above.

5. Otherwise, reasonable efforts should be made to produce a conservative estimate of the present value of future benefits on a statutory basis which, in the aggregate, carries out the objective above. Such conservative estimate, when divided by the Net Single Premium calculated in AG 38 8E, Step 5, produces the ratio.

6. For any shadow account secondary guarantee product designs with multiple charges/multiple credits the denominator of the ratio shall be limited to be no larger than the Net Single Premium as calculated in AG 38 8E, Step 5

Appendix D

GAAP Cross-Reference to SAP as of December 2021

Introduction

As expressed in the Statement of Concepts, statutory accounting principles (SAP) utilize the framework established by Generally Accepted Accounting Principles (GAAP). Appendix D includes GAAP pronouncements that have been considered or are pending consideration in the development of SAP.

The NAIC Codification of Statutory Accounting Principles Working Group addressed all GAAP pronouncements included in Category A, Category B and Category C issued through 1996 during the initial drafting of the SSAPs, as well as the AICPA Accounting Interpretations included in Category D. This working group is now called the Statutory Accounting Principles (E) Working Group (SAPWG).

- Category A – FASB Statements and Interpretations, APB Opinions, and AICPA Accounting Research Bulletins
- Category B – FASB Technical Bulletins, Board-Directed FASB Staff Positions, AICPA Industry Audit and Accounting Guides, and AICPA Statements of Position
- Category C – Consensus positions of the FASB Emerging Issues Task Force (EITF) and AICPA Practice Bulletins
- Category D – AICPA Accounting Interpretations

Subsequent to the NAIC codification of statutory accounting principles, as documented in the Policy Statement on the Maintenance of Statutory Accounting Principles (included in Appendix F), the SAPWG continued to review new GAAP guidance for applicability to SAP. Beginning January 1, 1999, the Emerging Accounting Issues (E) Working Group (EAIWG) was formed and began addressing FASB EITF opinions issued subsequent to 1996. The positions of the EAIWG are documented in an interpretation (INT) as indicated by reference in the applicable column of the GAAP Cross-Reference to SAP chart. Appendix B includes the full text of EAIWG INTs issued before December 31, 2015. In October 2010, the SAPWG undertook a project to incorporate authoritative guidance related to specific topics in one location. This means that guidance within INTs has been incorporated into the applicable SSAPs, where possible. Appendix D now references the applicable SSAP, not the nullified INT. Therefore, completely superseded SSAPs and nullified INTs are removed from the Manual and retained in *Appendix H – Superseded SSAPs and Nullified Interpretations*, which is posted for public reference on the SAPWG web page at https://content.naic.org/cmte_e_app_sapwg.htm. Under this approach, only current guidance is included in the Manual, while preserving the historical reference of previous authoritative SSAPs and INTs for accounting purposes.

In addition to the GAAP Cross Reference to SSAP, Appendix D includes a Nonapplicable GAAP Pronouncements supplement which contains a listing of GAAP pronouncements that have been considered in the development of SAP and deemed not applicable.

In June 2009, the FASB issued *FASB Statement 168, FASB Accounting Standards Codification and the Hierarchy of Generally Accepted Accounting Principles (FAS 168)*, effective for interim and annual periods ending after Sept. 15, 2009. FAS 168 (Topic 105 of the FASB Codification) identified the sources of accounting principles and the framework for selecting the principles used in the preparation of the financial statements of nongovernmental entities that are presented in conformity with generally accepted accounting principles (GAAP) in the United States. Pursuant to this standard:

- FASB Accounting Standards Codification was established as the source of authoritative accounting principles recognized by the FASB to be applied by nongovernmental entities. (SEC guidance included within the FASB Codification is provided for convenience and relates only to SEC entities.)
- Accounting Standards Updates issued after the effective date of FAS 168 are not considered authoritative in their own right. Such standards serve only to update the FASB Codification, provide background information, and provide the bases of conclusions on the changes to the FASB Codification.
- Effective September 15, 2009, all non-SEC accounting and reporting standards were superseded. Additionally, all nongrandfathered, non-SEC accounting literature not included in the Codification was deemed nonauthoritative. As of September 15, 2009, AICPA Statements of Position are no longer reviewed as part of the statutory maintenance process as they are no longer considered authoritative GAAP literature. If the AICPA were to address an issue that affects the FASB Codification, an accounting standard update (ASU) would be issued and reviewed for applicability to statutory accounting.

As a result of FAS 168, Appendix D – GAAP Cross Reference to SAP has been revised to include reference of FASB Accounting Standards Updates, as well as the Accounting Standards Codification Reference (Topic and Subtopic) for pre-codification GAAP guidance. Pre-codification GAAP guidance that has been superseded as a result of exclusion from the GAAP Codification has been identified within Appendix D. Users of the NAIC *Accounting Practices and Procedures Manual* shall continue to refer to the FASB pre-codification standards, and the applicable references to such standards, to determine the GAAP guidance that has been adopted, adopted with modification or rejected for statutory accounting.

To assist users in tracing pre-codification GAAP standards to the FASB Codification, Appendix D – GAAP Cross-Reference to SAP includes the Topic and Subtopic for all pre-codification GAAP standards that have been included in the FASB Codification. This FASB Codification reference does not reflect GAAP guidance adopted for statutory accounting. Only the guidance detailed in specific SSAPs or INTs shall be utilized in determining the GAAP guidance adopted, adopted with modification or rejected for statutory accounting. Items noted with “Not Explicitly Included in Codification” are no longer included in the FASB Cross Reference tool.

Information Provided in Appendix D – GAAP Cross-Reference to SSAP:

- Status – This column includes the SAPWG status of review. A “pending” status indicates that the SAPWG has not completed deliberation of the GAAP pronouncement. Items noted as “Not Board-Directed or SEC Update” will not be reviewed by the SAPWG unless specifically requested for review.
- Disposition – This column represents the general conclusion of the SAPWG/EAIWG for the stated GAAP pronouncement. This information is included in Appendix D as a reference tool, however, the guidance in the specific SSAP or INT shall be the authoritative source in determining the GAAP guidance adopted, adopted with modification or rejected for statutory accounting.
- Statutory Reference – This column provides the statutory accounting source addressing the GAAP pronouncement.
- Accounting Standards Codification Topic and Subtopic – This column provides a reference guide to trace pre-codification GAAP standards to the new FASB Codification.

In addition to the “GAAP Cross Reference to SSAP,” Appendix D includes the “FASB Codification to Pre-Codification GAAP” supplement. This supplement serves as a reference tool in tracing the FASB Codification to pre-codification GAAP standards that have been reviewed or are pending review as part of the current NAIC statutory accounting maintenance process. This supplement does not indicate which GAAP standards have been adopted, adopted with modification or rejected for statutory accounting. Pre-codification GAAP guidance not captured as part of the statutory accounting maintenance process, but that has been incorporated in the FASB Codification, has not been referenced within this supplement. Future consideration will occur on whether this pre-codification GAAP guidance will be reviewed for statutory accounting. Pre-codification GAAP included in the FASB codification, but not referenced within this supplement includes: FASB Derivative Implementation Group Issues; EITF Appendix D Topics; FASB Statement No. 138 Examples; FASB Staff Implementation Guides; AICPA Technical Inquiry Service and Audit and Accounting Guides. (The Audit and Accounting Guides (AAG) related to insurance have been reviewed for statutory accounting and are referenced in this supplement – HCO: Health Care Organizations, LHI: Life and Health Insurance and PLI: Property and Liability Insurance Companies. This supplement also does not include reference to the SEC standards incorporated within the FASB Codification: SEC Financial Reporting Releases; SEC Interpretive Releases; SEC Staff Accounting Bulletins; and SEC Regulation S-X.

¹ To assist users in tracing pre-codification GAAP standards to the FASB Codification, the FASB Codification Topic and Subtopic for all pre-codification GAAP standards has been included in this Appendix. This FASB Codification reference does not reflect GAAP guidance adopted for statutory accounting. The Accounting Practices and Procedures Manual (E) Subgroup was formed to assess changes necessary to reflect the new GAAP Codification within statutory accounting principles. Until this process is complete, or as otherwise noted in specific SSAPs or Interpretations, users of the *NAIC Accounting Practices and Procedures Manual* shall continue to refer to the FASB pre-codification standards, and the applicable references to such standards, to determine the GAAP guidance that has been adopted, adopted with modification, or rejected for statutory accounting.

² On December 5, 2009, the Statutory Accounting Principles (E) Working Group adopted revisions to the NAIC *Accounting Practices and Procedures Manual* to refer to the FASB Accounting Standards Codification as prescribed in *FAS 168, FASB Accounting Standards Codification and the Hierarchy of Generally Accepted Accounting Principles* (FAS 168). With the issuance of FAS 168, and the establishment of the FASB Codification, the previous GAAP hierarchy established in *FAS 162, The Hierarchy of Generally Accepted Accounting Principles* (FAS 162) has been eliminated. As a result of FAS 168, the FASB Accounting Standards Codification is the source of authoritative accounting principles recognized by the FASB. (SEC guidance included within the codification is provided for convenience and relates only to SEC entities.) Pursuant to previous decisions by the Statutory Accounting Principles (E) Working Group, FASB Staff Positions (FSPs) issued after May 9, 2008, will be reviewed as part of the statutory accounting maintenance review process. FSPs issued prior to May 9, 2008, will be reviewed as part of the maintenance process if considered to be “Board-directed”. (Board-directed FSPs were issued to provide narrow and limited revisions to the FASB statements or FASB interpretations formerly provided in FASB Technical Bulletins.) FSPs that were not considered “Board-directed” were considered to provide application guidance similar to that found in FASB Staff Implementation Guides and Staff Announcements and were previously classified (pre-FAS 162) as NAIC Level 5 guidance. Due to this Level 5 classification, these FSPs were not reviewed as part of the statutory accounting maintenance review process.

³ As of September 15, 2009, AICPA Statements of Position are no longer reviewed as part of the statutory maintenance process as they are no longer considered authoritative GAAP literature. If the AICPA were to address an issue that affects the FASB Codification, an accounting standard update (ASU) would be issued and reviewed for applicability to statutory accounting. Therefore, this table will no longer be updated after SOP 09-1.

Appendix D Nonapplicable GAAP Pronouncements for Statutory Accounting as of December 2021

In 2015, Issue Paper No. 99—Nonapplicable GAAP Pronouncements was removed from Appendix E and incorporated into this section of Appendix D.

For items presented to the Statutory Accounting Principles (E) Working Group, this table addresses Generally Accepted Accounting Principles (GAAP) pronouncements that are nonapplicable due to one of the following reasons:

- a. The pronouncement does not relate to the insurance industry;
- b. The pronouncement is not within the objectives of statutory accounting;
- c. The pronouncement would not add a substantive amount of guidance to statutory accounting due to the narrow scope of the topic;
- d. The pronouncement relates to transition of a previously issued GAAP pronouncement.

For items previously presented to the Emerging Accounting Issues (E) Working Group, this table includes references to EITFs that have been rejected for the following reasons:

- a. Rejected as not applicable to statutory accounting;
- b. Rejected without providing additional statutory guidance;
- c. Rejected on the basis of issues rejected in a SSAP.

*NOTE: EITFs marked with an asterisk were rejected as not applicable to statutory accounting on the basis of issues rejected in a SSAP (paragraph c. above).

GAAP pronouncements¹ not considered applicable to NAIC statutory accounting principles are summarized as follows:

NONAPPLICABLE GAAP PRONOUNCEMENTS FOR STATUTORY ACCOUNTING

GAAP Pronouncement	Title
<i>FASB Accounting Standards Updates (ASU)</i>	
ASU 2009-02	Omnibus Update—Amendments to Various Topics for Technical Corrections

Appendix D

FASB Codification Cross-Reference to GAAP Pronouncements as of December 2021

Information provided within this Appendix D supplement has been obtained from the FASB Cross-Reference Tool. This supplement serves as a reference tool in tracing the FASB Codification to pre-codification GAAP standards and post-codification GAAP accounting standard updates (ASU) that have been reviewed, or are pending review, as part of the current NAIC statutory accounting maintenance process. This supplement does not indicate which GAAP standards have been adopted, adopted with modification or rejected for statutory accounting, as this information is contained in previous sections of this appendix. The following information is not included within this supplement:

- Pre-codification GAAP guidance that has not been captured as part of the statutory accounting maintenance process, but that has been incorporated into the FASB codification, which includes FASB Derivative Implementation Group Issues; EITF Appendix D Topics; FASB Statement No. 138 Examples; FASB Staff Implementation Guides; AICPA Technical Inquiry Service and Audit and Accounting Guides
- SEC standards incorporated within the FASB Codification SEC Financial Reporting Releases; SEC Interpretive Releases; SEC Staff Accounting Bulletins; and SEC Regulation S-X.
- GAAP codification topics (and/or subtopics) that have been deemed not applicable to statutory accounting (e.g. Topic 920 – Entertainment-Films)
- GAAP codification topics (and/or subtopics) that had no reference to previous GAAP guidance reflected in the FASB Cross-Reference Tool.

The Audit and Accounting Guides (AAG) related to insurance have been reviewed for statutory accounting and are referenced in this supplement – HCO: Health Care Organizations, LHI: Life and Health Insurance and PLI: Property and Liability Insurance Companies.

Appendix E Statutory Issue Papers

Introduction

Issue papers are used as the first step in developing new or revised SSAPs, and each contains a recommended conclusion, discussion and relevant literature section. While issue papers do not constitute an authoritative level of statutory accounting guidance as defined by the statutory hierarchy, they are an important part of the *Accounting Practices and Procedures Manual* (Manual) because they reference the history and discussion of the related SSAP.

Issue papers are published in the Manual within Appendix E the first year after adoption of the related SSAP, but are then removed from the subsequent year's Manual and posted for public reference on the Statutory Accounting Principles (E) Working Group (SAPWG) web page at https://content.naic.org/cmt_e_app_sapwg.htm.

Statutory Issue Paper No. 165

Levelized Commission

STATUS

Finalized December 11, 2021

Original SSAP: SSAP No. 71; Current Authoritative Guidance: SSAP No. 71

Type of Issue:

Common Area

SUMMARY OF ISSUE

1. This issue paper documents for historical purposes the discussion of nonsubstantive revisions to *SSAP No. 71—Policy Acquisition Costs and Commissions*. The intent of these nonsubstantive revisions is to provide clarifying guidance to existing accounting requirements regarding levelized commission arrangements. The statutory accounting guidance in SSAP No. 71 has been in place since 1998 and is based on pre-codification guidance.

SUMMARY CONCLUSION

2. The nonsubstantive revisions to SSAP No. 71 adopted by the Statutory Accounting Principles (E) Working Group on March 15, 2021, the Accounting Practices and Procedures (E) Task Force on March 23, 2021, and the Financial Condition (E) Committee on April 13, 2021 (illustrated in Exhibit A), reflect the following:

- a. Provides additional descriptive guidance to assist with identifying levelized commission arrangements.
- b. Emphasizes the requirements noted in the original SSAP No. 71 guidance that levelized commission arrangements require full recognition of the liability amount. In addition, interest and or fees incurred to date are accrued.
- c. Specifies an effective December 31, 2021, for contracts in effect as of that date.

Policy Acquisition Costs Overview

3. Acquisition costs are those costs that are incurred in the acquisition of new and renewal insurance contracts and include costs that vary with and are primarily related to the acquisition of insurance contracts (e.g., agent and broker commissions, certain underwriting and policy issue costs, and medical and inspection fees). Pursuant to SSAP No. 71, as originally effective January 1, 2001, for the initial SAP Codification, specifically states that acquisition costs and commissions are expensed as incurred. This provision is a fundamental difference from U.S. generally accepted accounting principles (U.S. GAAP) and reflects a statutory concept that was employed prior to codification, as detailed in *Issue Paper No. 71—Policy Acquisition Costs and Commissions*.

- a. Under U.S. GAAP, paid or accrued acquisition costs, which include commission costs, are capitalized and reported as a deferred asset and expensed over time to match the recognition of revenue. Note that under U.S. GAAP and SAP, the liabilities associated with acquisition costs are the same. However, U.S. GAAP allows capitalization of certain acquisition costs where SAP requires immediate expense recognition. From information received on the basis of U.S. GAAP, commission obligations from the writing of an insurance policy would be recognized as a deferred acquisition cost regardless of a third-party arrangement.

- b. The departure from U.S. GAAP is consistent with original and ongoing SAP concepts that focus on the solvency of reporting entities for the protection of policyholders and not the matching of revenue to expenses. As detailed in the Preamble, the ultimate objective of solvency regulation is to ensure that policyholder, contract holder and other legal obligations are met when they come due and that companies maintain capital and surplus at all times and in such forms as required by statute to provide a margin of safety.
- c. As detailed in the Statutory Accounting Recognition Concept, accounting treatments that defer expense recognition do not generally represent acceptable SAP treatment. Even if consideration had occurred to mirror U.S. GAAP and allow the capitalization of expenses as “deferred assets,” such assets would not be considered admitted assets for statutory accounting. This is because such items do not reflect assets with economic value available for policyholder claims. Nonadmitted assets are required to be charged to surplus in the period in which they arise. As such, in either scenario under SAP, the financial statements of the reporting entity would reflect a reduction of available surplus (either through the recognition of expense or through a direct surplus charge for nonadmitted assets) for acquisition costs and commissions.

Levelized Commission - Background

4. Agenda item 2019-24 on levelized and persistency commission was drafted and presented to the Statutory Accounting Principles (E) Working Group at the request of a state department of insurance after the practice was identified on a financial examination. The issues received by the Working Group related to the use of levelized commission arrangements and the amount to be recorded as a liability in accordance with SSAP No. 71 and SSAP No. 5R—*Liabilities, Contingencies and Impairments of Assets*.

5. Both SSAP No. 71 and SSAP No. 5R have relevant guidance on this topic:

a. SSAP No. 71 describes levelized commission arrangements as follows:

4. Levelized commissions occur in situations where agents receive normal (non-level) commissions with payments made by a third party. It is intended, but not necessarily guaranteed, that the amounts paid to the agents by the third party would ultimately be repaid (with interest explicit or implied) to the third party by levelized payments (which are less than the normal first year commissions but exceed the normal renewal commissions) from the reporting entity. These transactions are, in fact, funding agreements between a reporting entity and a third party. The continuance of the stream of payments specified in the levelized commission contract is a mechanism to bypass recognition of those expenses which are ordinarily charged to expense in the first year of the contract. Consequently, the normal link between the persistency of the policy, the continuance of the premium payment or the maintenance of the agent's license with the reporting entity is not maintained with respect to the payment stream.

b. SSAP No. 5R defines liabilities as follows:

Liabilities

2. A liability is defined as certain or probable¹ future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or to provide services to other entities in the future as a result of a past transaction(s) or event(s).

¹ FASB *Statement of Financial Accounting Concepts No. 6, Elements of Financial Statements*, states: Probable is used with its usual general meaning, rather than in a specific accounting or technical sense (such as that in *FASB Statement 5, Accounting for Contingencies*, paragraph 3), and refers to that which can reasonably be expected or believed on the basis of available evidence or logic but is neither certain nor proved.

3. A liability has three essential characteristics: (a) it embodies a present duty or responsibility to one or more other entities that entails settlement by probable¹ future transfer or use of assets at a specified or determinable date, on occurrence of a specified event, or on demand, (b) the duty or responsibility obligates a particular entity, leaving it little or no discretion to avoid the future sacrifice, and (c) the transaction or other event obligating the entity has already happened. This includes, but is not limited to, liabilities arising from policyholder obligations (e.g., policyholder benefits, reported claims and reserves for incurred but not reported claims). Liabilities shall be recorded on a reporting entity's financial statements when incurred.

4. Estimates (e.g., loss reserves) are required in financial statements for many ongoing and recurring activities of a reporting entity. The mere fact that an estimate is involved does not of itself constitute a loss contingency. For example, estimates of losses utilizing appropriate actuarial methodologies meet the definition of liabilities as outlined above and are not loss contingencies.

Levelized Commission Funding Agreement

6. The levelized commission arrangements identified for agenda item 2019-24 had the following key elements:

- a. A third party (referred to as a “funding-agent”) paid selling agents commission amounts for business directly written on behalf of the reporting entity. These payments typically occurred in the first year of policy issuance and were consistent with normal initial sales commissions considered policy acquisition costs.
- b. The reporting entity repaid the funding-agent through a levelized commission arrangement that spread out the commission repayment over multiple years (e.g., 3-6 years). The yearly commission repayments to the funding agent also included additional fees and explicit or implicit interest charged to the reporting entity. Consistent with the guidance in SSAP No. 71, paragraph 4, this levelized commission arrangement is repaying the funding-agent amounts “which are less than the normal first year commissions but exceed the normal renewal commissions.” As noted, SSAP No. 71 characterizes such agreements as in substance, a funding agreement (i.e. loan).
- c. The example agreement between the reporting entity and the funding agent specified that the funding agent will not be reimbursed by the reporting entity if the policies that generate the commission are cancelled prior to the policy anniversary date. This reduction in commission payment for policy cancellation is not materially different than direct agreements with agents that have commission “claw back” features. However, regardless of claw back features, commission is fully accrued and expensed upfront. In the event there is a policy cancellation / lapse, then the liability accrued and recognized expense is adjusted for the amount of the commission that will not be paid.

7. The regulator noted that the reporting entity was not accruing all of the commission liability to the third-party funding agent. The insurance reporting entity employing the disputed practice asserted that the payments to the funding agent were theoretically avoidable until the policy had passed the anniversary date. The reporting entity did not accrue the full amount of initial sales commission that had already been paid on its behalf by the funding agent, which should have been recognized at the time the policy was sold. Although the entity should have recognized the full initial sales commission per SSAP No. 71, the reporting entity also did not accrue the next total expected payment to the third-party. The reporting entity only accrued the next payment when they viewed it as “earned” by the third-party agent. This “earned” date was typically the next policy anniversary when the payment to the funding agent became unavoidable. With this approach, the reporting entity was essentially incorporating a 100% lapse assumption in their process to recognize commission expense, as they would only recognize the commission expense when the policy

continued passed a specific lapse date. This assumption is not permitted in statutory accounting, and therefore not reflected in other aspects of their financial statements such as policy reserves.

8. The reporting entities employing the disputed practice asserted that even though commission has been paid by the funding-agent to the sub agent, that no commission should be accrued by the reporting entity until after the end of each policy year when the policy has persisted past its anniversary. The reporting entity was asserting that inserting a persistency clause into a funding agreement allowed them to avoid the liability accrual and expense recognition for the initial acquisition costs for the issued policy at the time the policy was issued.

9. The assertion from the reporting entity is not consistent with SSAP No. 71, paragraph 5:

5. The use of an arrangement where commission payments are not linked to traditional elements such as premium payments and policy persistency, but rather are linked to the repayment of an advance amount requires the establishment of a liability for the full amount of the unpaid principal and accrued interest which is payable to a third party related to levelized commissions.

10. The regulator viewed the disputed practice as a misapplication of the levelized commission guidance in SSAP No. 71 and that the reporting entity was underreporting its sales commission expense incurred and the related commission expense liability.

DISCUSSION

11. The accounting issue is whether levelized commission funding arrangements require the establishment of a liability for the full amount of the unpaid principal and accrued interest which is payable to a third party. The agenda item and the proposed revisions assert that guidance in SSAP No. 71, which has existed since prior to codification, requires accrual of the full amount that is repayable to the funding agent under the levelized commission agreement. It is important to highlight that the guidance in SSAP No. 71, nor the proposed clarifying edits, do not seek to prohibit funding agreements. The long-standing guidance simply requires full liability recognition to ensure continued consistent reporting across reporting entities of commission obligations.

12. During the discussion of the agenda item, it was identified that this disputed practice of not accruing the full liability for the commission expense was only employed by a small number of reporting entities that employ similar operational practices. It was identified that these limited number of insurers entered into third-party arrangements with the intent to defer the recognition of commission costs for surplus relief. This goes against long-standing statutory accounting guidance and results in those insurers presenting a better financial position than other reporting entities that applied the guidance in SSAP No. 71 when using third-parties to pay commission as well as reporting entities that pay commission directly to agents. The application of this approach by the small number of reporting entities employing the practice resulted in significant differences impacting consistency and comparability in statutory financial statements. From information obtained, it is believed that a vast majority of companies are following the guidance in SSAP No. 71 as originally intended.

13. Research identified that some capital-funding companies were facilitating the practice, with marketing efforts to promote the surplus relief provided by using their structure as a third-party payer. These capital-funding companies were also active commenters in response to the proposed edits to clarify the guidance in SSAP No. 71. Throughout the Working Group discussion, it was identified that if the guidance is not clarified, then all reporting entities would need to contract with third-party agents to pay commissions to prevent competitive disadvantages in reporting financial results in the statutory financial statements. For the small number of companies that have engaged in this practice, these entities have benefited from lower expense recognition. It also results with a decrease in liabilities, resulting with a calculation that fewer assets are needed to meet obligations and improving overall RBC calculations. These results were identified as concerning as the financial statements do not accurately represent the obligations of the reporting entity

from issued in-force policies and could hinder the proper assessment of whether there are appropriate assets available to satisfy policyholder claims and other contractual requirements of the reporting entity.

Development of Statutory Accounting Guidance

14. SSAP No. 71 was adopted in 1998 as part of base codification, which went into effect in 2001.

15. *Issue Paper No. 71—Policy Acquisition Costs and Commissions*, paragraph 10, identifies the pre-codification statutory accounting guidance that is the basis for the existing SSAP No. 71 guidance. The pre-codification guidance also notes the same concerns (reiterated in the agenda item 2019-24) if reporting entities use levelized commission arrangements which operate as funding agreements to inappropriately enhance surplus. *Issue Paper No. 71—Policy Acquisition Costs and Commissions*:

10. Chapter 17, Other Liabilities, of the Accounting Practices and Procedures Manual for Life and Accident and Health Insurance Companies contains the following guidance on levelized commissions:

Levelized Commission

The accounting treatment for certain transactions, characterized as levelized commissions, which results in enhancement of surplus, has been determined to be inappropriate for statutory reporting.

These transactions are, in fact, funding agreements between an insurer and a third party. Agents receive normal (non-level) commissions with payments made by the third party. It is intended, but not necessarily guaranteed, that the amounts paid to the agents would ultimately be repaid (with interest explicit or implied) to the third party by "levelized" payments (which are less than the normal first year commissions but exceed the normal renewal commissions) from the insurer. The continuance of the stream of payments specified in the levelized commission contract is a mechanism to bypass recognition of those expenses which are ordinarily charged to expense in the first year of the contract. Consequently, the normal link between the persistency of the policy, the continuance of premium payment or the maintenance of the agents license with the insurer is not maintained with respect to the payment stream.

The use of an arrangement where commission payments are not linked to traditional elements such as premium payments and policy persistency but rather are linked to the repayment of an advanced amount requires the establishment of a liability in the full amount of the unpaid principal and accrued interest.

16. The intent of SSAP No. 71 for levelized commissions is that repayment of an advance (by having a third party pay on the insurer's behalf), requires the establishment of a liability for the full amount of unpaid principal and accrued interest.

Contingent Commission versus Funding Agreement

17. SSAP No. 71, paragraphs 3-5, which are excerpted in the relevant statutory accounting section of this issue paper, describes both contingent commission and levelized commission agreements.

18. Contingent commission: SSAP No. 71, paragraph 3, provides the following key points:

- a. Contingent Commission liabilities are to be determined in accordance with the terms of each individual commission agreement.
- b. Commission liabilities determined on the basis of a formula that relates to loss experience shall be established for the earned portion.
- c. Assumptions used to calculate the contingent commission liability shall be consistent with the terms of the policy contract and with the assumptions made in recording other assets

and liabilities necessary to reflect underwriting results of the reporting entity, such as retrospective premium adjustments and loss reserves, including incurred but not reported.

19. Levelized commission: SSAP No. 71, paragraphs 4 and 5, discuss levelized commission with the following key points:

- a. Such transactions are noted as in substance to be a funding agreement or a loan between a reporting entity and a third party.
- b. Selling agents receive their normal commission from a third party and repayment of the commission amounts to the third party by the reporting entity are intended, but repayment (with interest explicit or implied) to the third party is not necessarily guaranteed.
- c. Commission repayment to the third party by the reporting entity is over time. The levelized commission payments are lower than normal first year (sales) commission, but higher than normal renewal commission.
- d. The levelized commission arrangements are described as an attempt to bypass the recognition of expenses, which are normally charged to expense in the first year of the insurance contract.
- e. This guidance also notes that the use of a levelized commission arrangement is an attempt to break the normal link between underlying policies and the expense recognition, by changing the timing of the payment stream.
- f. SSAP No. 71, paragraph 5, provides:

5. The use of an arrangement where commission payments are not linked to traditional elements such as premium payments and policy persistency, but rather are linked to the repayment of an advance amount requires the establishment of a liability for the full amount of the unpaid principal and accrued interest which is payable to a third party related to levelized commissions.

20. The key differences between traditional contingent commission paid directly to the selling agent and a levelized commission funding agreement that uses a third-party funding agent were a major component of the discussion prior to adopting the clarifying edits. The example brought to the Working Group was identified, by the regulator as a levelized commission funding agreement. Key levelized commission features of this example were: 1) the direct selling agents were paid their sales commission for policies written on behalf of the insurance reporting entity for year one commission by the third party; 2) the third-party funding agent was being repaid over time with some contingency elements in the third party levelized commission contract; and 3) the third party had typically advanced the funds to the selling agents in the same year that the policies were written (however some direct selling agents could choose different payment patterns).

21. Rather than accruing the total expected payments to the third party who had made commission payments to the direct selling agents, the reporting entity was only accruing commission expense based on when the next annual payment was due to the third-party. This levelized commission arrangement attempts to de-link the timing of recognition for the initial sales commission by inserting a third party.

22. As recognition of commission expenses is driven by policy events (such as the issuing or renewing of an insurance policy), the commission expenses had already been incurred, therefore, the reporting entities employing the disputed practice were viewed as underreporting their incurred commission expense and commission liabilities. This was not viewed as consistent with the principle of expensing acquisition costs when incurred or with the treatment of levelized commission funding agreements in SSAP No. 71.

23. In addition, it was identified that waiting to accrue the subsequent expected payments because the underlying policies might lapse in the future reflects a 100% lapse assumption. Using a 100% lapse assumption was noted as being inconsistent with the other financial statement assumptions regarding the underlying policies used for reserving, incurred but not reported claims, etc.

Contingent Commission versus Loan with Contingency Element

24. Comments received often characterized the third-party funding agreements as a persistency commission as support for why the full commission expense should not be required. The use of the term “persistency” in these instances is not in line with the traditional use of this term as it pertains to insurance contracts. Fundamentally, a persistency commission is commission that is earned over time as a policy is renewed or remains in force. A persistency commission occurs subsequent to an initial sales commission, where the triggering event is either the continuation or renewal of a policy. With these terms, an additional commission (beyond what was earned from the initial sales commission) is owed once the policy ‘persists’ overtime. Persistency commissions are generally much smaller payments than initial sales commission.

25. The third-party funding agreements reference to persistency commission in their contracts is not referring to additional commission owed with the continuation or renewal of a policy. Rather, they have taken the position that deferring the initial sales commission overtime and requiring portions of that initial sales commission to be paid to the third-party as the contract remains in force is akin to a persistency commission. This is not an appropriate comparison. As detailed, commission liabilities and the recognition of commission expenses shall occur in accordance with policy events. As such, with the issuance of an initial policy, the initial sales commission shall be recognized, with a liability accrual until paid, and with the recognition of the commission expense. If a policy remains in force over time, the terms of the contract may require additional commission to be paid to the selling agent. These additional commission amounts are considered “persistency” commissions and are only recognized when the policy event occurs that triggers the commission to be owed.

26. The following examples are included to assist with illustrating these concepts:

- a. Single Premium Immediate Annuity (SPIA): On January 1, 2020, agent sells a SPIA insurance policy and is owed \$1,000 in initial sales commission. Over the next 10 years, if the policy continues to be in force, on January 1, the selling agent is awarded a persistency commission of \$10, per year. This is a reward to the agent for the policy not being churned/terminated.
- b. Direct Agent Arrangement: On January 1, 2020, the reporting entity recognizes the \$1,000 as commission expense. On January 1, 2021 (and subsequent years) as the policy continues in force, reporting entity recognizes the \$10 persistency commission as incurred.
- c. Funding Agreement Arrangement: Rather than the reporting entity paying the \$1,000 initial sales commission directly to the agent upfront, the funding agent pays the initial \$1,000 commission to the selling agent. The insurer and the funding agent have an expectation that the reporting entity will repay the funding agent this amount over time. Under SSAP No. 71, an insurer is not permitted to insert a third-party to delay commission expense recognition. As such, under this arrangement the reporting entity insurer shall also recognize the full \$1,000 as commission expense on January 1, 2020. Additionally, the insurer should recognize the \$10 persistency commission on January 1, 2021 (and each year subsequent) if the policy continues to be in force. (This example does not reflect the recognition of the fees/interest of the funding agreement arrangement, which would also be required to be recognized.)

27. To be overly clear, the key concepts within these illustrations are as follows:

- a. The initial obligating event is the selling of the insurance contract. Commission expense for initial sales commission shall be recognized consistently by each insurer, regardless of third-party arrangements where a funding agent pays this on behalf of the insurer.
- b. The second obligation event is the persistency threshold in which additional commission is owed to the selling agent (policy did not lapse). This is also required to be recognized consistently by insurer regardless of any third-party arrangement.
- c. The small number of companies that have delayed recognition of initial commission expense due to the insertion of a funding agent have noted that their agreement allows them to avoid payment in the future even of policy cancellation (lapse). The proper accounting for commission in the event of policy lapse is to decrease the payable to the funding agent when the lapse occurs, not prior to the lapse.
- d. In addition to not altering the triggering event (initial issuance of policy), this dynamic does not reflect a traditional “persistency” commission. This funding agreement and use of a finance agent is simply a financing mechanism that the insurer has paid additional fees and interest to obtain. The proper accounting is to recognize the obligation for the full commission expense at the time of policy issuance, and then derecognize the obligation if, and only if, the insurer is no longer obligated to the funding agent. It is also noted that a third party would not pay large sums of money on an insurer’s behalf in an arm’s length transaction without an expectation of repayment.

Actions of the Statutory Accounting Principles (E) Working Group

28. On August 3, 2019, the Working Group moved this agenda item to the active listing, categorized as nonsubstantive, and exposed revisions to *SSAP No. 71—Policy Acquisition Costs and Commissions* to clarify levelized commissions guidance and provide additional direction regarding commissions that are based on policy persistency. The Working Group exposed initial revisions to paragraphs 2, 3, 4 and 5, which were intended to clarify both levelized and persistency commission because it was identified that some entities were trying to characterize their funding agreements as persistency commission. Key points in the exposed guidance were that:

- a. A levelized commission arrangement (whether linked to traditional or nontraditional elements) require the establishment of a liability for the full amount of the unpaid principal and accrued interest payable to a third party at the time the policy is issued.
- b. The persistency commission is accrued proportionately over the policy period in which the commission relates to and is not deferred until fully earned.

29. The exposed revisions were consistent with the original intent of SSAP No. 71 as well as the Statutory Statement of Concepts focusing on Recognition (excerpts from Preamble, paragraphs 37 and 38).

- a. Liabilities require recognition as they are incurred.
- b. Accounting treatments which tend to defer expense recognition do not generally represent acceptable SAP treatment.

30. On December 7, 2019, the Working Group exposed nonsubstantive revisions to SSAP No. 71 to provide clarifications to the long-standing levelized commissions guidance and provide additional guidance regarding commission that is based on policy persistency. The revisions proposed to clarify that a levelized commission arrangement (whether linked to traditional or nontraditional elements) requires the establishment of a liability for unpaid principal and accrued interest payable, regardless of the timing of payments made to a third party. Additionally, the exposed guidance required accrual of persistency commission over the associated policy period.

31. The December 7, 2019, revisions were to address some of the comments received from interested parties and two capital funding companies. It was affirmed that the levelized commission repayment amount is owed to the funding agent who made the advance on the insurer's behalf unless the policy has lapsed. It was noted that delaying payment to a third-party does not delay expense recognition. After this discussion, the guidance was exposed with the following revisions from the prior exposure:

- a. Paragraph 2 - Removed previously exposed revisions regarding persistency commission. These provisions were initially included because the levelized commission example included contingency features regarding repayment. Commenters expressed concern that the exposed revisions could have an inadvertent impact on traditional renewal commissions, which was unrelated to a levelized commission arrangement.
- b. Paragraph 3 - Added clarifying phrases regarding persistency commission accrual. The concept is that normal persistency commission is accrued for the period it relates to unless the policy is cancelled. This language was also added to address the industry comments regarding inadvertent impacts to traditional renewal commission.
- c. Paragraph 4 - Added two clarifying phrases to assist with identifying levelized commission funding agreements.
- d. Paragraph 5 - Added clarifying phrases regarding funding agreements.
- e. Footnote 1 - Redrafted to remove double negative wording.

32. The December 7, 2019, exposed nonsubstantive revisions were again intended to be consistent with the original intent of SSAP No. 71 as well as the Statutory Statement of Concepts focusing on Recognition (noted in the Preamble, paragraphs 37 and 38) stating that liabilities require recognition as they are incurred and accounting treatments which tend to defer expense recognition do not generally represent acceptable SAP treatment.

33. Notice of the December 7, 2019, exposure was also sent to the Life Actuarial (A) Task Force. The Working Group forwarded comments received at the 2019 Fall National Meeting inquiring whether there is specific *Valuation Manual* language in *VM-20, Requirements for Principle-Based Reserves for Life Products*, and *VM 21, Requirements for Principle-Based Reserves for Variable Annuities*, that needs to be addressed in the coordination process as part of this agenda item. It was noted that the Principles-Based Reserving (PBR) methodology takes commission into account when projecting the present value of future cash flows. However, the projected future cash flows would not be accrued in duplicative if there is an existing liability.

34. On March 18, 2020, the Working Group, deferred discussion of this item for a subsequent call or meeting. This deferral occurred as the 2020 Spring National Meeting was cancelled for COVID-19, and the interim call held by the Working Group was limited in the topics to address.

35. During the July 30, 2020, meeting, the Working Group reviewed comments from interested parties and on behalf of two capital funding companies.

- a. The proposed language from interested parties and one of the capital funding entities, as detailed in the following subparagraphs, was rejected by the Working Group as not viable and inconsistent with existing principles.
 - i. Interested parties' proposed language recommended deleting most of the exposed revisions and adding guidance that would redefine a funding arrangement to only include those items where repayment is guaranteed. This proposal was noted as being in conflict with the long-standing guidance in SSAP No. 71, paragraph 4, which notes that "It is intended, but not necessarily guaranteed, that the amounts

paid to the agents by the third party would ultimately be repaid...” It was also noted that the existing language in SSAP No. 71 seeks to look at the substance of the levelized commission arrangement noting that a third party would not prepay an entity’s commission expenses without an expectation of repayment.

- ii. One of the capital funding companies sent comments through a legal firm. Their comments proposed only requiring levelized commission liability recognition if the third party, which prepays the commission, is under the control or has common control with the insurance reporting entity. The perception of that comment was that if an unrelated party were the third-party funding agent that paid the upfront sales commission expense, no liability recognition would be required by the insurance reporting entity. This recommendation was also rejected as the substance of the transaction is a loan and the accrual of a liability for a loan is the same under SSAP No. 5R for related and unrelated parties.
- b. The Working Group also noted a concern with the capital funding company’s comments regarding assumption of lapse risk by noninsurance entities such as brokers and other third parties. The capital funding company’s comment letter (via the legal firm) asserted that the third-party broker, by virtue of their agreement, has assumed “lapse risk, mortality risk and the commission expense obligation.” The Working Group noted that some of the identified items which were noted as being transferred to the broker are insurance risks that can only be transferable to an insurance entity through a reinsurance agreement.
- c. The comments from the other capital funding company focused on unintended consequences and potential impacts to various entities. It asserted that the clarifying edits to the existing language are a substantive change. The Working Group noted that the proposed revisions are trying to emphasize existing language that has been in effect prior to codification that is being ignored by some reporting entities in an attempt to defer expense recognition. The Working Group affirmed that expensing acquisition costs when incurred is a long-standing principle in statutory accounting.
- d. While commenters agreed that the commission obligations are ultimately liabilities/expenses, they noted that the issue is when to record the liability/expense. The discussion noted that the accrual of sales commission liabilities and the corresponding recognition of expenses are incurred when the insurance contract is written, not when the payment is due. It also noted that an insurer is responsible for the policy acquisition costs of its directly written policies.

36. After the discussion on July 30, 2020, the Working Group exposed additional nonsubstantive revisions to SSAP No. 71 to clarify the original levelized commission guidance and provide additional direction regarding commissions that are based on policy persistency. The exposed edits would require reporting entities that have not complied with the original intent of SSAP No. 71 to reflect the change as a correction of an error (as a mistake in the application of an accounting principle) pursuant to *SSAP No. 3—Accounting Changes and Corrections of Errors* in the December 31, 2020, financial statements. In accordance with SSAP No. 3, correction of accounting errors in previously issued financial statements, for which an amended financial statement was not filed, are to be reported as an adjustment to unassigned funds (surplus) in the period in which the error was detected. This guidance also requires disclosure in accordance with SSAP No. 3. Part of the reason the exposure included correction of error guidance, as opposed to change in accounting principle, is that the Working Group identified that the practice was employed by a small number of reporting entities purposely for surplus relief and it was viewed as inconsistent with the long-standing guidance in SSAP No. 71. Further, it was identified that some funding companies were actively promoting the use of these third-party arrangements as a way to increase surplus by avoiding the recognition of commission expense when incurred.

37. On October 15, 2020, the Working Group held a hearing to receive comments from interested parties and from the American Institute of Certified Public Accountants' NAIC Task Force (AICPA Task Force).

38. Both interested parties and the AICPA disagreed with the correction of an error treatment and stated a preference to have the classification as a change in accounting principle. It was noted that referring as a correction in error could result with issues in previously filed financial statements, prior exams, and previously issued audit opinions. The Working Group agreed to remove the previously exposed correction of error guidance in paragraph 7 and to revert to the change in accounting principle guidance. When making this decision, it was noted that the resulting financial statements would ultimately have a similar result. Under the change in accounting principle guidance, a reporting entity reflects the cumulative effect of the change as an adjustment to unassigned funds (surplus) in the period of change of the accounting principle. This guidance provides that the cumulative effect is the difference between the amount of capital and surplus at the beginning of the year and the amount of capital and surplus that would have been reported at that date as if the accounting principle had been applied retroactively to all prior periods. For a correction of error, domiciliary states may require entities to file corrected financial statements for all prior periods that reflected the error. If this direction does not occur, the change is required as an adjustment to unassigned funds in the period the error is detected. As such, by permitting this correction to be reported as a change in accounting principle, the impacted reported entities will not be subject to different treatment by domiciliary states with the resubmission of previously filed financial statements to correct the error. Rather, all impacted entities will have a consistent approach to update their financial statements accordingly.

39. The Working Group discussed the other comments and proposed revisions from interested parties regarding contingency commission. The Working Group did remove more of the contingent commission guidance that was previously exposed in paragraph 3 to address concerns regarding potential impacts on traditional commission and renewals. This was viewed as addressing the remaining concerns about unintended impacts from the majority of industry that is not using funding agreements.

40. The Working Group also agreed to move the proposed effective date to January 1, 2021, to allow the small number of entities that are employing the practice the opportunity to consult with their domiciliary regulators.

41. With this discussion the Working Group again highlighted that the revisions are a nonsubstantive clarification of existing longstanding provisions of SSAP No. 71 which have been in place before 1998 and are only not being applied by a small number of reporting entities. As some commenters noted the materiality impact to the small number of entities that engaged in this practice, it was noted that under the *NAIC Policy Statement on Maintenance of Statutory Accounting Principles*, it is not the impact of a change on an individual entity that determines whether a change is substantive or nonsubstantive, but rather if the change alters original intent.

Excerpt from Policy Statement on Maintenance of Statutory Accounting Principles:

Nonsubstantive revisions to SAP will be developed to address, but will not be limited to: 1) clarification of the intent or application of existing SSAPs; 2) new disclosures and modification of existing disclosures; 3) revisions that do not change the intent of existing guidance; and 4) revisions to Appendix A—Excerpts of NAIC Model Laws to reflect amendments to NAIC adopted model laws and regulations.

42. After the discussion on October 15, 2020, the Working Group exposed updated revisions to SSAP No. 71 to clarify existing levelized commissions guidance, which requires full recognition of funding agreement liabilities incurred for commission expenses obligated when an insurance policy is written. (This guidance clarifies that writing the insurance policy is the obligating event for initial sales commission.) The exposed revisions have the following key changes from the prior exposure:

- a. Improved description of the funding agreements in paragraphs 4 and 5.
- b. Deletes the previously proposed revisions in paragraph 3 regarding other types of commission to address the comments received regarding unintended impacts on traditional renewal commission.
- c. Modifies the revisions in paragraph 7 to remove the language on correction of an error.
- d. Proposes the nonsubstantive revisions apply to contracts in effect on January 1, 2021.

43. On November 12, 2020, the Working Group held a hearing to receive comments on the October exposure. Comments were received from interested parties, the Mississippi Department of Insurance and a former New York state regulator. Key points from the review of comments were as follows:

- a. Given the year-end timing and the material impact to what is believed to be a very limited number of companies, the Working Group discussed having another exposure, with minor edits, to clarify that the revisions would apply to contracts in effect as of the effective date to later be specified by the Working Group. While the Working Group did not want to have the guidance in effect on January 1, 2021, a few members stated a preference to having the guidance effective upon adoption sometime in 2021.
- b. The Working Group discussed the comments from the Mississippi Department of Insurance, interested parties and a former New York regulator that the changes appear to be substantive.
 - i. It was identified that the revisions have already had the due process required for either a substantive or a nonsubstantive change since it has had multiple exposures and public discussions.
 - ii. The Working Group affirmed that the proposed revisions are a nonsubstantive clarification of existing longstanding provisions of SSAP No. 71 which have been in place since prior to 1998. It was noted that under the *NAIC Policy Statement on Maintenance of Statutory Accounting Principles*, it is not the impact of a change on an individual entity that determines whether a change is substantive or nonsubstantive, but rather if the change alters original intent.
 - iii. It was also noted that the *NAIC Policy Statement on Maintenance of Statutory Accounting Principles* allows for drafting of an issue paper subsequent to the adoption of revisions. An issue paper can be drafted for either substantive or nonsubstantive revisions.
- c. The former New York regulator generally opposed all of the revisions. He noted that the total commission paid will not change under this guidance, but rather only the timing of commission expense recognition will change. In response to these comments, Working Group members noted that the total commission expense is actually higher using these third-party arrangements because the funding agents charge interest and/or fees.

44. The Working Group also discussed and rejected the following revisions proposed by interested parties:

- a. The proposed interested parties' revisions would have allowed both a reduction in commission expense recognition and the delay in commission expense timing. The parties employing the disputed practice are trying to use persistency features in a funding agreement to defer and decrease the funding agreement liability. Interested parties' comments advocated that the funding-agent fronting commission does not require recognition because of the insertion of a persistency contingency provision into the funding agreement. They noted that this persistency contingency provision might allow the reporting entity to avoid repayment of the past advance if the policy is subsequently cancelled. These proposed revisions were not incorporated as they are not in line with the original intent of the guidance and because it is not permissible to assume 100% lapse risk in recognition commission expense. It is only if a policy has been cancelled can a reporting entity derecognize the accrued liability/ commission expenses.
- b. Interested parties' proposed revisions that commission funding agreements should only be accrued when repayment is guaranteed. This position has been previously rejected by the Working Group as it is in direct conflict with the existing guidance in SSAP No. 71, paragraph 4 which requires accrual of the full amount of a levelized commission agreement even when repayment is not guaranteed. It was noted that the purpose of the levelized commission guidance is to identify that the substance of the levelized commission is a funding arrangement. It identifies that a third party in an arm's length transaction would not pay acquisition costs on behalf of an insurer without expectation of repayment and expectation of profit. The guidance requires recognition of the full amount of the funding agreement liability even if repayment is not guaranteed. The funding agreement is an attempt to de-link the relationship to the underlying policy from the normal day one accrual of sales commission. The funding agreement advance made by the third party is made with an expectation of repayment. Thus, the liability for amounts already advanced by the funding agent is not extinguished as a liability (under SSAP No. 5R or SSAP No. 103—*Transfers and Servicing of Financial Assets and Extinguishments of Liabilities*) until it has either been repaid or the policy is cancelled.
- c. The interested parties recommended revisions to recognize a reduced and delayed liability for the funding amount. They recommended ignoring the funding agreement nature of the advances and only recognizing the next payment because the policy might be cancelled in the future. It was again noted that this is the equivalent of assuming a 100% lapse rate on the policies. This position is similar to setting up the liability for a single payment on a loan instead of the entire principal balance. This proposed revision was rejected as inconsistent with the existing guidance in SSAP No. 71 which requires full accrual of the funding agreement liability.
- d. Interested parties' recommended revisions to add a new reference to *SSAP No. 52—Deposit Type Contracts* for the recognition of funding agreement liabilities. This was possibly an attempt to allow the funding agreement liability to be calculated using actuarial assumptions in the calculation of the liability. This would be inconsistent with SSAP No. 71 which does not allow discounting of such a liability.
- e. Interested parties commented that "SSAP No. 71 is consistent in the application of persistency being part of the transfer of the risk (liability) to another party. If the lapse risk (persistency) is transferred to another party, the liability that the insurance company may have, is also transferred to that party and the insurance company has no liability." However, it was noted that guidance in Appendix A-791 on Life and Health Reinsurance identifies that lapse risk, which is an insurance risk, can only be transferred via reinsurance. The

Working Group disagreed that insurance risk liabilities can be extinguished with a commission agreement with a noninsurance entity, which seems to be the position of interested parties.

- f. It was also noted that because of the persistency feature in the funding agreement, interested parties' commenters were advocating to not recognize any commission expense in these arrangements until it is due to the third-party agent. Similar to other positions, this is the equivalent of a 100% lapse assumption. This assertion is not consistent with any other assertions reflected in the recognition of these insurance policies in their financial statements.
- g. The Working Group did not support the comment by interested parties that under a levelized commission agreement another party is responsible for an insurer's acquisition costs. It was noted that statutory accounting requires acquisition costs to be expensed as incurred, not shifted to a non-insurance entity. Interested parties were asserting that even though a third party prepaid their acquisition costs that they do not have to recognize an accrual for the levelized commission funding agreement. This position was rejected by the Working Group. The Working Group affirmed that a funding agreement is not the same as traditional persistency commission. The Working Group affirmed the original SSAP No. 71 guidance that the substance of a levelized commission agreement is a loan.

45. The Working Group discussed the overall statutory accounting concepts of conservatism and consistency which require that statutory financial statements reflect assets available for policyholder claims with comparable financial information. It was noted that allowing delayed expense recognition of initial policy commission expenses will contradict both statutory accounting concepts, as assets will be included that are not available for policyholder claims (as they are needed for non-recognized commission expenses) and will result with financial statements that are not comparable to other insurance entities. Working Group members also expressed concerns with the competitive advantages that were occurring with companies that were employing these practices and stated a preference to have the guidance in effect in 2021.

46. After the discussion on November 12, 2020, the Working Group took the following actions:

- a. The proposed effective date of January 1, 2021 was changed to be effective upon adoption, and revised text was added to explicitly state that the proposed revisions will apply to contracts in effect as of the date of adoption.
- b. Determined that the revisions to SSAP No. 71 had met the due process for either a substantive or a nonsubstantive revision but concluded to keep the revision classified as nonsubstantive as the edits are in line with the original intent of SSAP No. 71. The Working Group reiterated that it is not the impact of a change on an individual entity that determines whether a change is substantive or nonsubstantive, but whether the revision is in line with the original intent of the SSAP. The Working Group noted that the proposed revisions to SSAP No. 71 are clarifications to the existing guidance consistent with original intent. Commissioner Donelon (LA) noted an objection to the classification as nonsubstantive.
- c. Directed NAIC Staff to draft an Issue Paper to document the discussion on this topic for historical purposes.

47. On March 15, 2021, the Working Group discussed written comments received from six parties including the 1) Montana Commissioner (now U.S. Representative) Matthew M. Rosendale, Sr., 2) a former North Carolina Commissioner 3) National Council of Insurance Legislators (NCOIL), 4) Interested parties, 5) one capital management company, and 6) a national conglomerate insurer. The key points from comments were summarized and draft responses were provided in the hearing materials for the meeting.

- a. Comments that there is no reason to change as current programs have been around for decades, been subject to external audits and insurance examinations and have not

previously been noted of concern. (Montana commissioner, former North Carolina commissioner, capital company and the national conglomerate insurer).

- i. Materials response - It was noted that identifying levelized commission transactions is difficult, without an in-depth review. When this was identified on a 2017 state examination, the reporting entity refused to recognize the full liability, which is why this issue was brought to the Working Group. The guidance to recognize the full liability amount for a levelized commission transaction has been a statutory accounting requirement since before 1998. This guidance is in place to recognize that the substance of an arrangement that has a third party pay an insurer's sales commission costs, is a loan. This is because a third party would not pay out large amounts of costs on another's behalf without an expectation of repayment.
- b. Comments that the change is substantive based on impact and needs more study and review for unintended consequences. (Montana, former North Carolina commissioner, NCOIL, interested parties, the capital company and the national conglomerate insurer)
 - i. Materials response - As noted in earlier meetings, under the *NAIC Policy Statement on Maintenance of Statutory Accounting Principles*, it is not the impact of a change on an individual entity that determines whether a change is substantive or nonsubstantive. To the extent this is a clarification of existing guidance, the revisions are consistent with the nonsubstantive classification.
 - ii. Materials response - Agenda item 2019-24 has been under discussion since August 2019, and the March 2021 meeting will be the sixth public discussion of this item. This item has been discussed: 1) August 2019; 2) December 2019; 3) July 2020; 4) October 2020; 5) November 2020 and 6) March 2021. It was noted that the underreporting of commission liabilities appears to be a practice employed by only a very small number of reporting entities.
- c. Comments that there can be a negative RBC impact. The former North Carolina Commissioner, NCOIL, and the capital company all noted concern with the potential negative impact to risk-based capital which will result with the revisions requiring companies employing the disputed practice to recognize the full funding agreement.
 - i. Materials response - Reporting previously unrecognized liabilities can have negative RBC impacts; this is why the adoption of the agenda item was delayed from year-end 2020. The delay was to allow the small number of reporting entities which are employing the disputed practice to have an opportunity to have discussions with their regulators. However, it is highlighted that the unrecognized liability also resulted with improved financial statements (and better RBC) than what should have been recognized based on actual operations.
- d. Possible consumer rate increases on guaranteed renewable long-term care were noted by the former NC commissioner and the capital company.
 - i. Materials response - The disputed practice is underreporting incurred commission expense and the obligation to repay it to a funding agent. This financing activity is being used to delay/under report incurred commissions. However, the total commission cost is typically slightly higher as the funding agents charge a fee and or interest (implicit or explicit) for their services. As such, the full financial statement impact is not as clear cut as implied in this comment.

- e. Effective date comments were varied. NCOIL was against a 2020 effective date, however that comment appeared to be related to the prior October exposure. NCOIL also requested a delay for the issue paper and recommended a five-year phase-in. The interested parties and the national insurance conglomerate advocated for an effective date no sooner than December 31, 2021, to allow time to work with regulators, auditors etc.
- i. Materials response - Effective Date - The Working Group discussed proposed language which allows a December 31, 2021, effective date.
 - ii. Materials response - Phase-in - This is viewed as a practice employed by a small minority of reporting entities, but the potential impact is material. Some Working Group members and some members of industry have noted the unfair competitive advantage that entities which employ this practice are receiving, because it underrepresents the incurred liabilities. Prior Working Group discussions have indicated that a phase-in would need to be a permitted practice granted by the domiciliary regulator.
- f. Interested parties' comments asserted that lapse risk under the contracts had been transferred to a noninsurance entity, with the following comments "The existing SSAP No. 71 guidance is consistent in the application of persistency being part of the transfer of the risk (liability) to another party. If the lapse risk (persistency) is transferred to another party, the liability that the insurance company may have, is also transferred to that party and the insurance company has no liability. Removing persistency as a factor in the accrual of commissions is a dangerous precedent. The differentiation between commissions based on real insurance risks versus payments based solely upon the passage of time in SSAP No. 71 goes directly to the risk transfer issue of one type of level commissions versus another. The proposed additional language eliminates this differentiation."
- i. Materials response - Statutory accounting guidance in Appendix A-791 on Life and Health Reinsurance identifies that lapse risk can be transferred via reinsurance. Transferring lapse related liabilities with a commission agreement with a noninsurance entity, was not viewed as a viable option under statutory accounting. The long-standing guidance in SSAP No. 71 requires full accrual of the funding agreement liability even if repayment is not guaranteed.
 - ii. Materials response - Because of the persistency feature in the funding agreement, interested parties' commenters are advocating to not recognize any commission expense in these arrangements until it is due to the third-party agent. This is the equivalent of a 100% lapse assumption. This assumption would be inconsistent with any other assertions reflected in the recognition of these insurance policies in their financial statements. The overall statutory accounting concepts of conservatism and consistency require that financial statements reflect assets available for policyholder claims with comparable financial information. Allowing delayed expense recognition of initial policy commission expenses will contradict both statutory accounting concepts, as assets will be included that are not actually available for policyholder claims (as they are needed for non-recognized commission expenses) and will result with financial statements that are not comparable to other insurance entities.
- g. Interested parties resubmitted some of the previously rejected proposed paragraph 4 revisions which seek to codify the industry position that funding agreements, which incorporate contingencies linked to traditional elements, should not be treated as a funding agreement (i.e. excluded from liability recognition).

- i. Materials response - The proposed revisions were not incorporated as proposed language seeks to codify the treatment which has previously been rejected as inconsistent with the guidance in SSAP No. 71.
- h. Interested parties resubmitted some of the previously rejected proposed paragraph 5 revisions to replace most of the exposed paragraph with language that is less detailed and which seeks to codify the industry position that funding agreements which incorporate contingencies linked to traditional elements should not be treated as a funding agreement (i.e. excluded from liability recognition).
 - i. Materials response - The proposed revisions were not incorporated as proposed language seeks to codify the treatment which has previously been rejected as inconsistent with the guidance in SSAP No. 71.
- i. Interested parties commented that the exposed language which describes funding agreements, is too broad. Notes a concern that interim pay downs are not mentioned.
 - i. Materials response - Additional guidance regarding interim payments to paragraph 5 were not added because liabilities are always reduced when paid. This is detailed in SSAP No. 5R and SSAP No. 103R.

48. Interested parties commented that, “The current revisions require the accrual of a liability in situations that are inconsistent with the guidance SSAP No. 5R. Under a levelized commission program a third party has the obligation for the full initial sales commission. The insurer’s obligation under a levelized commission program that incorporates persistency should be accrued to the extent of legally contracted amounts owed. We do not believe the original intent of the SSAP required accruing for amounts that are not yet due and that may never be due. We strongly feel that the recognition of an obligation based on persistency is in accordance with the principles of SSAP 5R.”

- a. Materials response - The comment by interested parties indicates that under a levelized commission agreement another party is responsible for an insurer’s acquisition costs. This is not appropriate as statutory accounting requires acquisition costs are expensed as incurred, not shifted to a non-insurance entity. The position of interested parties is that even though a third party prepaid an insurer’s acquisition costs that the insurer does not have to recognize an accrual for the levelized commission funding agreement because in some situations such as future policy cancellation, the insurer might not have to pay. This is rejected as inconsistent with SSAP No. 71 guidance and inconsistent with SSAP No. 5R.
- b. Materials response - SSAP No. 5R incorporates an obligation to recognize contingent amounts that are probable and can be reasonably estimated. The difference is that a levelized commission arrangement is repaying a loan where in most cases the advance of the loan amount has already been made. The loan has contingency elements that may allow the loan repayment to be reduced in the future. Until the policy is cancelled there is a presumption that the amounts will be repaid. This is different from making a future commission payment on commission that has not yet been earned which occurs under traditional persistency commission. The elements of a liability under SSAP No. 5R:
 - i. Current obligation to pay for a past transaction - the insurer has a contract to repay the funding agent (current obligation). The service that is being paid for is the selling agent's sale of the insurance contract (past transaction). The guidance in SSAP No. 71 provides that related interest payments for the financing charges do not meet the definition of a liability until the passage of time for the interest has occurred. The insertion of a persistency element to the funding-agent funding agreement does not extinguish the entire pending liability. Such a liability would only be extinguished by payment or other legal release such as policy cancellation.

The advance liability to the third party is for a past transaction- that is, the funding agent has paid commission to the direct agents for the sale of the policy.

- ii. Payment probable of occurring - Payment of the obligation has to be probable of occurring. The only difference between the "persistency linked" funding arrangement and one where payment is guaranteed, is obviously the potential that principal will not be repaid due to lapse. However, the funding agents are not taking this risk without being compensated. The funding agreements are using a conservative estimate of expected lapses and factoring in a profit for the funding agent, hence the existing wording in SSAP No. 71 regarding interest explicit or implied. Therefore, a third-party funding agent would not be willing to provide financing if they did not think it was probable that they would have their full investment, plus a return on investment repaid. As such, the probable element of SSAP No. 5R is also met. The payment is probable and can be estimated and therefore meets the accrual requirements of SSAP No. 5R.

49. On March 15, 2021, the Working Group discussion included the following key points:

- a. Mr. Bruggeman (OH) and Ms. Marcotte (NAIC) introduced agenda item 2019-24: Levelized and Persistency Commissions. The Working Group has been discussing this topic since August 2019 with this being the sixth public discussion. This agenda item was drafted in response to a specific state insurance regulator request to address an accounting practice identified during a financial examination. It was noted that a few insurers are utilizing a disputed practice by using third parties to pay policy acquisition costs, and they are not recognizing the full liability to repay those third parties. Not recognizing the full liability to repay the parties who are paying acquisition costs on an insurer's behalf is inconsistent with the guidance in *SSAP No. 71—Policy Acquisition Costs and Commissions*. SSAP No. 71, which has been in place prior to 1998, provides statutory accounting guidance and identifies such agreements as funding agreements, which require full liability recognition. Mr. Bruggeman stated that NAIC staff have provided a summary of comments received, which includes a response to each position. Accordingly, NAIC staff are not recommending additional modifications.
- b. Commissioner Mulready (OK) inquired as to whether actions taken by the Working Group regarding this project would go through the complete NAIC committee process, including reporting to the Accounting Practices and Procedures (E) Task Force and the Financial Condition (E) Committee and review by the Executive (EX) Committee and Plenary. Mr. Bruggeman stated that due to the controversial nature of this topic, this agenda item will be specifically considered through all levels of the committee process.
- c. Commissioner Mulready further inquired regarding the expense recognition and payment of cashflows for using a third party to pay policy acquisition costs compared to insurers who directly pay commission expense. Mr. Bruggeman stated that traditional life insurance policies typically have a larger commission in the first year the policy is written. Through the use of a third party, some insurers have used a levelized repayment plan, so the first-year commission is repaid over several years. Additionally, the immediate expense recognition for this first-year commission, as required under SSAP No. 71, is not being properly recognized by some insurers in the year of acquisition. As a third party has remitted funds on behalf of an insurer, the insurer needs to properly recognize the loan as a liability.
- d. Commissioner Mulready inquired about lapse risk, which is a common element built into these financing agreements. Mr. Bruggeman commented that lapse risk cannot be transferred to a noninsurance entity; and SSAP No. 71 still requires the liability to be

recognized, even if repayment to the third party is not guaranteed. Mr. Bruggeman further stated that by not recognizing the full commission financing liability, an insurance company is asserting a 100% lapse rate, which is not an appropriate assumption and not consistent with the reserving methodology used for these products.

- e. Ms. Nettleton (Guggenheim) stated that levelized commissions are not a new concept. She noted that a 2010 U.S. Securities and Exchange Commission (SEC) complaint against another carrier notes that levelized commissions were common practice. She stated that the concept of persistency remains a concern, as Guggenheim believes expense recognition will occur earlier than has traditionally been required. She stated that Guggenheim feels it is a dangerous practice to remove persistency in the treatment of levelized commission. Mr. Bruggeman stated that the concepts regarding traditional persistency commission are not a part of the proposed edits, as this agenda item is to clarify that initial acquisition costs should not be deferred through the use of a funding agreement.
- f. Mr. Stolte (VA) stated that in 1991, Virginia had an insolvency in which the company participated in a structure where it utilized a levelized commission financing arrangement and did not properly recognize a liability for the amounts paid by the third party. However, as the insurer was liquidated, the third-party financier sought reimbursement for commission amounts previously forwarded on behalf of the insurer. Mr. Stolte stated that the insurer had not recorded the full amount of the liability, and this overstated surplus. He stated that if these amounts due are not recorded, they are in essence off book, unrecorded liabilities. He stated that the concept of recognizing commission expenses when incurred has been a long-standing concept of statutory accounting, which was noted even prior to codification. He noted that acquisition costs are expensed as incurred upfront.
- g. Commissioner Donelon responded that the insurer referenced by Mr. Stolte did a levelized commission practice; however, he perceived the accounting practice was fully transparent, and the \$16 million amount of the off-balance sheet liability only represented a fraction of the \$120 million insolvency. He stated that earlier exposures of this item, involved other large life insurers; however their earlier concerns appear to have been accommodated. He inquired regarding the nature of this accommodation. Mr. Bruggeman stated that this comment pertains to clarification involving true persistency commissions—i.e., subsequent year commissions—were not intended to be captured in the scope of levelized commissions revisions in SSAP No. 71. He said the initial revisions were perceived by the broader insurance industry as affecting traditional persistency commission and the Working Group subsequently clarified that that was not the intent of the revisions. Ms. Gann (NAIC) stated that SSAP No. 71 is a common area SSAP, so it is applicable to all insurer and product types. She stated that the intent of the SSAP No. 71 revisions is to capture initial acquisition costs and commissions from the issuance of a policy, not traditional persistency commissions that arise subsequent to initial commissions which are common in many insurance products.
- h. Thomas B. Considine (National Council of Insurance Legislators—NCOIL) stated that NCOIL believes that the changes proposed are substantive in nature and the timing of an adoption is less than prudent, especially in light of the current economic environment. He noted that the revisions will have adverse capital consequences on some companies. Companies utilizing levelized commission structures have done so for decades, and in conjunction with this requiring a significant financial impact, NCOIL would recommend a four or five-year phase-in of expense recognition. Mr. Stolte stated that in response to a multi-year phase-in request, insurers affected could request a permitted practice from their state of domicile. In doing so, a multi-year phase-in could be granted; however, the financial and capital impact could be appropriately disclosed. Mr. Considine stated that

permitted practices are not viewed as favorably as uniform treatment, and this would not be a preferred solution.

- i. Lynn Kelley (Delaware Life), on behalf of interested parties, stated that they do not agree with the proposed edits, and they believe the edits are substantive in nature. She stated that interested parties believe that their accounting practices have been in compliance with SSAP No. 71 and have been subject to numerous insurance exams and independent financial audits. If adopted by the Working Group, an effective date no earlier than December 31, 2021, is requested. She stated her support also for a multi-year phase-in.
- j. Mr. Bridgeland (Center for Insurance Research—CIR), NAIC consumer representative, stated that the most important function of statutory accounting is to ensure solvency and a level playing field among similar insurers. He stated that an insurer's financial statements should reflect capital available to pay policyholder claims and not permit off-balance sheet liabilities. Despite this requiring material adjustments to a few insurers, he stated that adoption was recommended to ensure that financial statements appropriately reflect an insurer's financial position. He stated that if deferring the recognition of commissions is what is maintaining a company in the appropriate risk-based capital (RBC) range, then the company may warrant additional scrutiny for other areas as well.
- k. Mr. Bruggeman stated that as the edits proposed do not change the original intent of SSAP No. 71, he views the edits as nonsubstantive in nature. He stated that the concept of requiring immediate expense recognition of initial acquisition costs meets the spirit of statutory accounting concepts, as well as the concept of conservatism as referenced in the preamble. Commissioner Donelon stated that he believes this issue to be substantive in nature, even if it is not in the technical accounting sense. He indicated that the reporting entity that contacted him indicated that it will not have a materially adverse impact on them. However, he has been told that there are reporting entities that will have a significant financial impact on some small companies, and it will jeopardize members of the ACLI and the National Alliance of Life Companies (NALC). He stated recommendation for grandfathering of existing practices or a multi-year phase-in of any recognition requirements. He stated his agreement with Mr. Considine that a permitted practice is not preferred. Mr. Smith stated that when referencing the definitions of substantive versus nonsubstantive in the *Accounting Practices and Procedures Manual* (AP&P Manual), the exposed edits are nonsubstantive in nature.
- l. Commissioner Mulready stated that this practice has been in place for decades, and to classify this as nonsubstantive signifies to him that all prior insurance exams and independent audits are incorrect. Ms. Andersen (IL) stated that the proposed edits are only clarifying in nature, as they do not change the intent of SSAP No. 71. She stated that this practice has only been employed by a small number of insurance entities, and it results in liabilities that are not recorded in the financial statements. Mr. Stolte stated that commission financial arrangements are difficult to discover; in the prior insolvency example referenced, it was not until the company was in receivership that the issue was discovered. He noted that such arrangements create illusory surplus and violate the concepts of statutory accounting and audits do not review every single contract.
- m. Mr. Bruggeman stated that nonsubstantive agenda items are generally effective immediately; however, due to the nature of this topic, it will need to be approved by the Accounting Practices and Procedures (E) Task Force, the Financial Condition (E) Committee, and the Executive (EX) Committee and Plenary. With the Executive (EX) Committee and Plenary not meeting until the Summer National Meeting, the earliest this adoption could take effect is likely the third quarter of 2021. Mr. Smith (VA) stated that

due to the length that this agenda item has been discussed, they would support an immediate effective date. Ms. Belfi (CT), Mr. Fry (IL), Mr. Clark (IA) and Mr. Kim Hudson (CA) recommended a December 31, 2021, effective date. due to the likelihood of a significant financial impact combined with the requirement for adoption by the Executive (EX) Committee and Plenary. In an inquiry from Mr. Bruggeman, no Working Group member was opposed to a December 31, 2021, effective date, which is the effective date suggested by Delaware Life per the comments from Ms. Kelley.

- n. As this agenda item directs that any adjustments be accounted for as a change in accounting principle under *SSAP No. 3—Accounting Changes and Corrections of Errors*, the effective date will not have a material impact, as any required cumulative adjustments calculated as of January 1, 2021, will impact unassigned funds (surplus). Mr. Bruggeman stated that upon adoption, insurers will be required to record a liability for outstanding amounts due to a third-party funding agent as a cumulative effect adjustment to surplus as of January 1. He noted that activities throughout the year after January 1 are recorded through income.
50. On March 15, 2021, the Working Group took the following actions with Louisiana voting in opposition.
- a. Directed NAIC staff to update this Issue paper for March 2021 and subsequent actions to allow for future exposure. It was noted that the non-authoritative issue paper does not need to be adopted prior to implementation of the SSAP No. 71 revisions.
 - b. Supported an annual statement blanks proposal to provide a new general interrogatory to identify the use of a third party for the payment of commission expenses, which will be concurrently exposed with the Blanks (E) Working Group.
 - c. Adopted the exposed revisions to SSAP No. 71 with a December 31, 2021, effective date. The Working Group affirmed the nonsubstantive classification of these revisions as consistent with the original intent of SSAP No. 71.
51. On March 23, 2021, the Accounting Practice and Procedures (E) Task Force adopted the report of the Working Group. The Task Force conducted a separate vote on the SSAP No. 71 revisions. The motion passed with 41 in favor and the states of Louisiana and Oklahoma opposed.
52. Key aspects of the March 23, 2021, Task Force discussion are provided below.
- a. Mr. Bruggeman provided an overview of agenda item 2019-24 regarding levelized commission, which affects *SSAP No. 71—Policy Acquisition Costs and Commissions*. He stated that the Working Group has been discussing this item since August 2019, when it was brought to the Working Group by a domiciliary state. Mr. Bruggeman stated that after six public discussions, the nonsubstantive revisions that clarify the guidance in SSAP No. 71 regarding levelized commissions were adopted on March 15, 2021, with a December 31, 2021, effective date. Thirteen Working Group members voted in favor of adoption, and one member was opposed.
 - b. Mr. Bruggeman stated that both U.S. GAAP and SAP would calculate acquisition costs in a similar manner. However, one of the major financial reporting differences between SAP and GAAP is that GAAP capitalizes acquisition costs and expenses them over time to match revenue and expenses while SAP expenses policy acquisitions costs as incurred. Mr. Bruggeman stated that at the heart of this issue is that a small number of reporting entities are using third parties to pay their sales commission costs and not recognizing the full liability of what is in essence a loan to repay the third parties as required under SSAP No. 71. He said that the Working Group has had extensive discussion on this topic and has

noted that the revisions clarify the long-standing principles in SSAP No. 71, which have existed since even prior to codification. He stated that the revisions were classified as nonsubstantive because the revisions emphasize the original principles regarding funding agreements and the impact to a minor number of companies do not determine the classification of the revisions.

- c. Mr. Bruggeman noted that state insurance regulators and consumer representatives also voiced concerns about the illusory surplus and unlevel playing field such arrangements create. He stated that because of the unfair competitive advantages that are perceived, the Working Group was not in favor of grandfathering the practices. He noted that the Working Group did discuss that companies could have discussions with their domiciliary states regarding obtaining a permitted practice for phasing in the financial impact. because the impact to the affected companies may vary.
- d. Louisiana staff stated that Commissioner James J. Donelon could not attend the meeting, but he wanted his comments that this is a substantive change noted and also that he is in favor of a phase-in period. Oklahoma staff also noted that Oklahoma also supports the comments from Louisiana.
- e. Ms. Kelley (Delaware Life) stated that their position is also that the revisions are substantive and that they appreciate the time that the Working Group has spent discussing this issue even if not all of the edits they submitted were incorporated. She also stated support for an effective date at least as late as December 31, 2021.
- f. Elly Nettleton (Guggenheim Life and Annuity) highlighted two points from their prior comment letters: 1) levelized commissions are not a new concept and date back several decades. She noted that a 2010 U.S. Securities and Exchange Commission (SEC) complaint against another carrier identified levelized commissions as a common practice in the industry. She said Guggenheim is not aware that the accounting treatment was determined not to be in accordance with statutory accounting principles; and 2) traditional commissions such as those tied to policy persistency are carved out of the proposals. Ms. Nettleton said Guggenheim believes it is a dangerous precedent to remove persistency as a factor in the accrual of commissions as it is a key insurance element. Mr. Bruggeman noted that similar comments as Ms. Nettleton's were made at the Working Group. He stated that the Working Group did hear the comments but did not agree with them.
- g. Thomas Considine (National Council of Insurance Legislators—NCOIL) stated that NCOIL members feel strongly that the revisions are substantive but are willing to put that aside and do not feel the need to debate that classification again at this time. He stated that this is a practice that has been going on for decades. He stated that to implement this change during a period of great economic turmoil seems not only short-sighted, but also it is dangerous to require entities to make such a change in a period of a year. He stated that NCOIL recommends a significant phase-in period with a proposed effective date of December 31, 2025. He stated that a permitted practice does not reflect positively on the state granting the practice or the reporting entity receiving the practice. He stated that accreditation reviews note the permitted practices granted by a jurisdiction. He stated that the most fair and equitable solution and a way to avoid the debate of change classification is to add a four- or five-year phase-in.
- h. Mr. Bruggeman stated that funding agreements to levelized commission costs are not prohibited. He said the issue is that the full liability for the funding agreement must be recognized for the inherent loan. In other words, it is a financing arrangement; it does not delay the timing of recognition of the acquisition costs. He stated that a permitted practice

may not have a positive perception. However, permitted practice disclosure requirements allow state insurance regulators to understand the surplus impact of the arrangement. He stated that a permitted practice provides transparency and noted that if there were any decisions to extend the effective date beyond December 31, 2021, there would need to be a disclosure of the impact. Ms. Walker (TX) agreed, noting that consistency, meaning the ability to compare reporting entities' financial positions, is a fundamental concept that statutory accounting is based on. She noted its importance for solvency regulation.

- i. Mr. Considine noted that to address Mr. Bruggeman's point about state insurance regulators' information needs, he is confident that if there were a four- or five-year phase-in, legislators would be supportive of a reasonably tailored data call. Mr. Rehagen (MO) asked if Mr. Considine envisioned a confidential data call or one that would be publicly produced. Mr. Considine indicated he assumed if it were for the state insurance regulators, then such a data call would be confidential. However, he said NCOIL would be open to discussion. Mr. Bruggeman stated his intent was for a disclosure to be part of the public statutory accounting filing.
- j. Mr. Stolte stated that the Task Force is discussing noncompliant statutory accounting by a handful of companies. He stated that in 1991, Virginia had an insurance receivership of a large life insurance company that had a deferred commission funding arrangement. He said that the insurer had not booked the liability, but when the company was put into receivership, the funding entity/financier filed with the receivership a request for payment of \$16 million. He said that the reporting entity prior to the receivership was reporting \$120 million in surplus, but true surplus ended up being approximately \$4 million. He said he disagreed with the statement that what the handful of companies are doing is an acceptable SAP practice. He said it is noncompliance with statutory accounting in SSAP No. 71, and also with the statutory accounting guidance that existed even prior to codification. He said from a level playing field perspective, he does not want to be forced to approve such agreements for his companies to be able to compete with reporting entities employing this practice. He stated that not recording the full liability for the funding agreements creates illusory surplus. He stated that if a reporting entity needs more time to implement the revisions, a permitted practice is what should be employed. He noted that he received notification of more than 100 permitted practices in an average year. He stated that the permitted practices are designed to provide transparent disclosure for all state insurance regulators.
- k. Mr. Considine stated that what Mr. Stolte is terming "noncompliance" has been accepted in the regulatory community for 20 years. He said if reporting entities have been doing so for 20 years, it seems unreasonable to require a change in one year. Mr. Stole said that in Virginia, they have not accepted such practices. He noted that there may be some that they were unaware of, but they do not view it as an acceptable practice. He stated that this has been noted as problematic in a formal examination report, and he respectfully disagrees with Mr. Considine's statement that it was an acceptable practice. Ms. Walker also noted that she has been a Texas state insurance regulator for 20 years and is not aware of any entities that are using funding agreements to defer the recognition of acquisition costs. She noted that she would also take exception to doing so if it were identified in an examination or other regulatory review.
- l. Mr. Bridgeland (Center for Insurance Research—CIR) stated support for the proposal as adopted by the Working Group. He stated that one of the top priorities for state insurance regulators was ensuring that the insurers are solvent. He stated that part of that is also ensuring that there is a level playing field. He stated that in this case, there are a handful of

companies using a technique that, by their own admission, is enhancing surplus. He noted that as a consumer advocate, he does not want to see insurers have illusory surplus.

53. On April 13, 2021, the Financial Condition (E) Committee, adopted the revisions with 11 in favor and the three states of Mississippi, New Mexico, and South Carolina dissenting. The following key comments were part of the discussion:

- a. Commissioner White stated that the last item on the agenda is an issue that has received a considerable amount of discussion within the Statutory Accounting Principles (E) Working Group over the last couple years. He stated that unlike the premium refund issue from 2020, where the Committee overturned the adoption of a position and suggested that the issue be redrafted, he does not believe that should occur for this particular issue. He stated that the reason for this was that it was his understanding that the vast majority of the life insurance industry is very much opposed to the practice that has apparently been used by what we think is a handful of companies. The reason being is they believe it gives those handful of companies an unfair competitive advantage over the rest of the industry that has been abiding by Statement of Statutory Accounting Principles (SSAP) No. 71—*Policy Acquisition Costs and Commissions* ever since its inception, as well as even dating back before at least the 1990s. He suggested that if the Committee does not adopt this item, his understanding is that it would force the Working Group to change the entire SSAP No. 71 to allow all commissions and related acquisition costs to be deferred and amortized over time. The reason this would be required is that is essentially what the handful of companies are doing today, while the rest of the industry expenses these costs at the inception of the contract in accordance with statutory accounting principles (SAP). Commissioner White summarized that this would require the Working Group to go back and basically adopt U.S. Generally Accepted Accounting Principles (GAAP) for this particular issue, even though this is one of the biggest differences between SAP and U.S. GAAP. He noted that even if the Committee adopts the issue, it still needs to be adopted by the Executive (EX) Committee and Plenary. He also noted that he already recommended that the Executive (EX) Committee and Plenary consider taking it up either at the Summer National Meeting or during an interim call of the Executive (EX) Committee and Plenary.
- b. Ms. Walker noted that included in the materials is a document that provides an overview of the levelized commission agenda item 2019-24 from the Working Group, which modifies SSAP No. 71 through a clarification. She discussed how the Working Group began discussion on the issue in August 2019, and on March 15, 2021, the Working Group adopted nonsubstantive revisions illustrated at the end of the attachment, with an effective date of December 31, 2021. The Working Group vote was 13 states in favor and one state opposed. On March 23, 2021, the Accounting Practices and Procedures (E) Task Force adopted the Working Group's revisions without modification. The vote was 41 members in favor and two opposed (Louisiana and Oklahoma).
- c. Ms. Walker discussed that although U.S. GAAP and SAP calculate acquisition costs in a similar manner, one major financial reporting difference between the two is that U.S. GAAP capitalizes acquisition costs and expenses them over time to match revenues and expenses while SAP expenses policy acquisitions costs as incurred. This accounting treatment is in line with the SAP Statement of Concepts, particularly the recognition concept. This concept specifically identifies that accounting treatments that defer expense recognition are not generally acceptable under SAP.
- d. Ms. Walker noted that this agenda item was initiated because some reporting entities are using third parties to pay their sales commission costs without recognizing the full liability to repay the third parties, as required under SSAP No. 71. These entities have taken the position that their agreements are not funding agreements, as they pass on lapse risk to the

third party. Ms. Walker discussed how the Working Group has noted that the revisions clarify the long-standing principles in SSAP No. 71, which have existed since even prior to codification. The nonsubstantive revisions emphasize the original principles that require full liability recognition for the commission paid on an insurer's behalf and any interest and fees incurred to date. Ms. Walker described how the Working Group noted that it is not permissible to pass insurance lapse risk to a non-insurance entity. Furthermore, as the commission is owed with the issuance of an insurance contract, the proper recognition shall continue to require recognition at the time the insurance contract is issued. Ms. Walker indicated that the Working Group confirmed that it is not permissible to utilize a third-party payer of sales commission as a means to defer recognition of commission expenses.

- e. Ms. Walker described how if the agenda item is adopted, a small number of companies will have a material financial impact. She emphasized that because of the unfair competitive advantages that are perceived, and as the guidance is in line with the original intent of SSAP No. 71, the Working Group did not adopt grandfathering or transition provisions. She discussed how the Working Group has recommended that affected companies speak to their domiciliary states regarding potential permitted practices, as needed, for phasing in the financial impact. This approach was favored because the impact to the affected companies may vary, and it provides disclosure in Note 1 to ensure the comparability of all insurers with SAP. Ms. Walker noted that it is her understanding that most companies are not employing this practice and will not be affected by the agenda item's adoption.
- f. Superintendent Toal (NM) suggested that the Committee should consider modifying the effective date from the current proposed year-end 2021 to year-end 2022. Ms. Walker stated that the Working Group had already delayed the effective date from its usual practice of effective upon adoption for nonsubstantive items such as this, but the Working Group wanted to allow time for domestic states to work with any of their companies affected. She also described how a further delay was considered, but since the vast majority of the industry is complying, such a suggestion was rejected by the Working Group. Superintendent Toal questioned whether having less than six months allows enough time for companies to make the changes necessary. Commissioner Donelon repeated a comment that he indicated he has made in the past, which was that even though this was not a substantive change, the real-world impact to some companies was to the tune of hundreds of millions of dollars; therefore, grandfathering of the old contracts, perhaps on a phased-in approach, should be allowed. He described that he had been directed to some communication from the U.S. Securities and Exchange Commission (SEC) where this practice was identified as far back as 30 years ago. He described how such companies therefore may have been using this practice in good faith, or at least one they believed was appropriate, and they are being asked to record hundreds of millions of changes in surplus from this practice. He stated that for this reason, he and other commissioners have interceded in this process. Mr. Slape (TX) stated that the reference to SEC action may not be accurate, as he believes the facts indicate that the company was in worse financial condition after entering into these transactions. In essence, these companies are borrowing money, paying interest on that borrowed money, then competing against other companies that are following the current accounting requirements. Mr. Slape noted that this is not a new issue; this is the first thing that a state insurance regulator learns about regarding the differences between SAP and U.S. GAAP.
- g. Commissioner White indicated that everything he has been told is that this may have been taking place within a handful of companies, but that does not mean the state insurance regulators of those companies were aware of its existence in those companies. He described how this is not readable or identified in the financial statements since it is an unrecorded liability. He described how expensing these costs as incurred has been a bedrock principle

within statutory accounting for years, even before SSAP No. 71 was adopted in 2001. He noted that he understands the argument for phasing in the impact, given that it could be material for some companies; however, the other side of that is the argument about the level playing field. He emphasized what Ms. Walker said earlier about affected companies working with their domestic regulator about a permitted practice, which is disclosed in Note 1 of the financial statements. Commissioner Donelon stated that he believes from his experience as a commissioner for so many years that the term “permitted practice” certainly comes with a negative connotation. He stated that for the companies he has heard from, the affected companies are unwilling to pursue a permitted practice. However, he stated his appreciation for the time that the Committee and its subsidiary task forces and working groups have given to this issue.

- h. Mr. Galbraith (AR) asked if it is possible to determine definitively if there were just a handful of companies and also whether the practice will definitively cease with all companies going forward on the same level playing field if the proposed changes are adopted. Commissioner White stated that he has heard no evidence to the contrary that it was anything more than a handful of companies since he believes state insurance regulators would have heard from those companies that are affected, and he noted that he is aware of companies in only three states where this is an issue. He described how this is a difficult practice to identify since it is not recorded in the financial statements. He also stated that with the significant discussion, the industry appears to be very aware of the issue, and the vast majority of the industry is supportive of the clarification to have a level playing field.
- i. Commissioner Mulready stated his support for the comments made by Commissioner Donelon, noting that his concerns have never been about the issue but rather the implementation. He stated his understanding that grandfathering may be difficult, but a delayed effective date, as suggested by Superintendent Toal, should be considered. Commissioner White responded that he believes that point was debated at the Working Group and the Accounting Practices and Procedures (E) Task Force. Commissioner Mulready noted that as a result of these discussions, Oklahoma had sent communication to all of its domestics to determine if other insurers are affected, and he suggested that he is sure other states are likely doing the same thing. Commissioner White stated his support for that practice, noting that it allows the domestic regulator to determine what is best for any affected companies. Wayne Goodwin, former North Carolina Insurance Commissioner, stated that he had previously submitted comments on this issue, noting slippery slope concerns with what could happen if it is implemented as quickly as is suggested since those concerns affect consumers. He stated his support for comments from Commissioner Donelon, Commissioner Mulready and Mr. Galbraith, and he noted concern about the potential impact on smaller carriers.
- j. Superintendent Toal stated that he wants to be clear in the idea of moving to a level playing field, and he is not objecting to the policy, rather his objection was with the limited time to implement, particularly given that state insurance regulators do not know the number of companies affected. Commissioner White responded that his deputy refers to the issue that arises from this practice as illusory surplus, and if in fact there are millions in unrecorded liabilities, that indicates information should be available to solvency regulators and indicates a level of concern. Ms. Walker stated that she believes this is a consumer protection issue, and her highest responsibility is ensuring that carriers can pay policyholder claims as they come due. She stated that when she hears some of the concerns that are being stated, as the domiciliary regulator, she needs the companies to come speak to her so that the two can work out a practice that takes care of consumers while considering the concerns of the company. She stated that the Accounting Practices and Procedures Task Force is trying to adopt some disclosures to gather information on companies, but that

depends upon accurate completion by the company, something that may not occur given this particular accounting practice of expensing commissions as they are incurred, which is a fundamental bedrock of statutory accounting that differs from other standards. She noted that there was discussion of trying to obtain more data on the companies using this practice, but the companies did not come forward to their state insurance regulator even though that was requested. So, while a complete scope is not known, the Working Group and the Task Force did not receive information from state insurance regulators that are on the Task Force or follow it. Ms. Walker also noted that the current proposed effective date of year-end 2021 is already a delay. Mr. Slape suggested that if this is going to have hundreds of millions of impacts on a handful of companies, that is illusory surplus, and that raises questions about the solvency of such insurers using this practice. Therefore, it could have an impact on this small number of companies.

- k. Ms. Kelley (Delaware Life Insurance Company), on behalf of interested parties, stated that this is an issue that has been discussed for some time, and she appreciates the ongoing discussions of the Committee and NAIC staff that have worked with Delaware Life. She strongly advocated for additional time to work through this implementation because Delaware Life still believes there are unanswered questions with regard to the calculations. She stated that Delaware Life has advocated all along for an extended effective date. She stated that Delaware Life maintains that this is a substantive change and believes that it has applied SSAP No. 71 in good faith, with all prior financial statements subject to examination and audit. Mr. Corbett (Guggenheim Life and Annuity Company) stated that the accounting for levelized commissions has been presented as a solvency issue, whereby companies have unrecorded liabilities for future commission payments. If this is the case, the liability is deemed necessary for policyholder protection, so how would the Committee be comfortable with any persistency commissions being recorded over time when all insurers have policy experience to be used as a basis for estimating the liability for these future expected commission payments. Therefore, the obligating event, which is defined by one of three essential characteristics in *SSAP No. 5R—Liabilities, Contingencies and Impairments of Assets*, has not occurred until the policy anniversary date. Mr. Corbett noted that paragraph 2 of SSAP No. 71, which contains no proposed modifications to the definition of a liability, determine when that liability has been incurred. The proposed changes to levelized commissions with a link to persistency are contradictory to paragraph 2. Commissions that are paid and earned according to persistency, which is a long-standing insurance element, should be treated in a consistent manner to ensure comparability among reporting entities. Guggenheim believes the proposed changes to SSAP No. 71 sets a dangerous precedence for the need to accrue for other liabilities for other predictable future expenses. Ms. Walker noted that the expense is incurred for the first year when the policy is written. So, even if the funding agreement allows the company to pay the sales agent in the future, that does not allow the company to defer expenses the first year of the policy. She stated that by deferring, and not recording the liability, and making the statement that it is not due until after the period is contrary and has a different assumption. The assumption that one does not have to book the liability until the policy is still in effect ignores the fact that the policy is currently in effect. As long as the policy is in effect, that amount will be owed. Therefore, you are not to adjust the liability down until the policy lapses or is cancelled. Using a funding agreement simply changes the timing of when the payment is due and does not affect if there should be an expense. Mr. Slape said these are not persistency commissions because in those situations the agent is paid a commission in future years for when that policy stays in force. These are referred to as renewal commissions, and they are reported on the future anniversary date, but the first-year commission must be expensed immediately up front regardless of the existence of a funding agreement since that is a loan. Mr. Slape stated that he takes issue with the statement that these funding agreements provide for a persistency commission.

1. Roger Sevigny (Sevigny Consulting), as a former state insurance regulator, stated that what he keeps hearing is a lack of information, and he asked that the work be slowed down. Commissioner Donelon stated that with respect to the companies referred to, they are owned by wealthy owners and some of the largest insurers in the world. Commissioner White stated that the debate has been vigorous, and he reminded everyone that even if the Committee votes to adopt the proposal, it will still need to be considered by the Executive (EX) Committee and Plenary. at the Summer National Meeting or during an interim meeting before that date.

54. The revisions were adopted by the Executive (EX) Committee and Plenary on August 17, 2021, with 10 jurisdictions voting as opposed. The discussion primarily centered around whether to allow a one-year deferral of the effective date to December 31, 2022. The December 31, 2021, effective date was maintained.

RELEVANT STATUTORY ACCOUNTING

55. Existing guidance in *SSAP No. 71—Policy Acquisition Costs and Commissions*.

3. Contingent commission liabilities shall be determined in accordance with the terms of each individual commission agreement. Commission liabilities determined on the basis of a formula that relates to loss experience shall be established for the earned portion. Assumptions used to calculate the contingent commission liability shall be consistent with the terms of the policy contract and with the assumptions made in recording other assets and liabilities necessary to reflect underwriting results of the reporting entity such as retrospective premium adjustments and loss reserves, including incurred but not reported.

4. Levelized commissions occur in situations where agents receive normal (non-level) commissions with payments made by a third party. It is intended, but not necessarily guaranteed, that the amounts paid to the agents by the third party would ultimately be repaid (with interest explicit or implied) to the third party by levelized payments (which are less than the normal first year commissions but exceed the normal renewal commissions) from the reporting entity. These transactions are, in fact, funding agreements between a reporting entity and a third party. The continuance of the stream of payments specified in the levelized commission contract is a mechanism to bypass recognition of those expenses which are ordinarily charged to expense in the first year of the contract. Consequently, the normal link between the persistency of the policy, the continuance of the premium payment or the maintenance of the agent's license with the reporting entity is not maintained with respect to the payment stream.

5. The use of an arrangement where commission payments are not linked to traditional elements such as premium payments and policy persistency, but rather are linked to the repayment of an advance amount requires the establishment of a liability for the full amount of the unpaid principal and accrued interest which is payable to a third party related to levelized commissions.

Effective Date

56. As issue papers are not represented in the Statutory Hierarchy (see Section V of the Preamble), the subsequent consideration and adoption of this issue paper will not have any impact of the December 31, 2021, effective date of the nonsubstantive revisions adopted to SSAP No. 71 by the Working Group on March 15, 2021.

EXHIBIT A – NONSUBSTANTIVE REVISIONS TO SSAP No. 71—POLICY ACQUISITION COSTS AND COMMISSIONS**Statement of Statutory Accounting Principles No. 71****Policy Acquisition Costs and Commissions**

SCOPE OF STATEMENT

1. This statement establishes statutory accounting principles for policy acquisition costs and commissions.

SUMMARY CONCLUSION

2. Acquisition costs are those costs that are incurred in the acquisition of new and renewal insurance contracts and include those costs that vary with and are primarily related to the acquisition of insurance contracts (e.g., agent and broker commissions, certain underwriting and policy issue costs, and medical and inspection fees). Acquisition costs and commissions shall be expensed as incurred. Determination of when acquisition costs and commissions have been incurred shall be made in accordance with *SSAP No. 5R—Liabilities, Contingencies and Impairments of Assets*.

3. Contingent commission liabilities shall be determined in accordance with the terms of each individual commission agreement. Commission liabilities determined on the basis of a formula that relates to loss experience shall be established for the earned portion. Assumptions used to calculate the contingent commission liability shall be consistent with the terms of the policy contract and with the assumptions made in recording other assets and liabilities necessary to reflect underwriting results of the reporting entity such as retrospective premium adjustments and loss reserves, including incurred but not reported.

4. Levelized commissions occur in situations where agents receive normal (non-level) commissions with payments made by a third party. It is intended, but not necessarily guaranteed, that the amounts paid to the agents by the third party would ultimately be repaid (with interest explicit or implied) to the third party by levelized payments (which are less than the normal first year commissions but exceed the normal renewal commissions) from the reporting entity. These transactions are, in fact, funding agreements between a reporting entity and a third party regardless of how the payment to the third party is characterized. The continuance of the stream of payments specified in the levelized commission contract is a mechanism which attempts to bypass recognition of those expenses which are ordinarily charged to expense in the first year of the contract. Consequently, the normal link between the persistency of the policy, the continuance of the premium payment or the maintenance of the agent's license with the reporting entity is not maintained with respect to the payment stream.

5. The use of an arrangement such as a levelized commission arrangement where commission payments are not linked to traditional elements such as premium payments and policy persistency, but rather are linked to the repayment of an advance amount paid by a third party to the direct selling agents requires the establishment of a liability by the reporting entity for the full amount of the unpaid principal and accrued interest which is payable to a third party related to levelized commissions. Arrangements that use a third party to pay agents who write policies for the reporting entity and the insured can be an attempt to de-link the relationship between the insurer and those agents and defer or levelize the acquisition commissions. The insurance reporting entity is required to recognize the full amount of earned commission costs to the direct policy writing agents even if those costs are paid indirectly to the agents by a third party through the use of levelized commission, or similar arrangement, which is in substance a funding arrangement. Having a third party pay commission costs to the selling agent is strong evidence of a potential funding arrangement which shall be recognized as a liability because the substance of the arrangement indicates that repayment is reasonable and probable, even if a contingency has been incorporated into the funding arrangement, until

the underlying policy has been cancelled. A third-party structure cannot recharacterize (e.g. by referencing policy persistency) and delay recognition of liabilities for initial sales commission owed from the writing of policies regardless of how a third-party arrangement is structured with regards to the timing of payment from the insurer. The amount owed for full initial sales commission shall be recognized immediately as the writing of an insurance contract is the event that obligates the insurer, and such action shall occur consistently among insurers. As such, this recognition is required regardless of if the insurer owes a selling agent directly or if a third-party has been contracted to provide payment to the selling agent.

NAIC Policy Statement on Maintenance of Statutory Accounting Principles

1. Statutory accounting principles (SAP) provide the basis for insurers to prepare financial statements to be filed with and utilized by state insurance departments for financial regulation purposes. Accuracy and completeness of such filings are critical to meaningful solvency monitoring. Accordingly, maintenance of SAP guidance for changes in the industry and changes in regulatory concerns is vital to preserving the usefulness of SAP financial statements.

2. The promulgation of new or revised SAP guidance by the NAIC ultimately requires action of the entire NAIC membership. Responsibility for proposing new or revised SAP guidance will be delegated through the NAIC committee structure to the Accounting Practices and Procedures (E) Task Force (Task Force). The Task Force will charge the Statutory Accounting Principles (E) Working Group (Working Group) with the exclusive responsibility to develop and propose new statements of statutory accounting principles (SSAPs), to revise existing SSAPs, and to issue interpretations.

Composition of the Statutory Accounting Principles (E) Working Group

3. The chair of the Task Force shall determine membership of the Working Group subject to approval by the Financial Condition (E) Committee. The Working Group shall be limited in size to no more than 15 members and will include representation from the four zones of the NAIC. Membership shall be vested in the state (until such time as the membership may be changed) but continuity of individuals, to the extent possible, is extremely desirable.

Development of New SSAPs or New SAP Concepts¹ in an Existing SSAP ~~Substantively Revised SSAPs~~

4. New SSAPs will be developed to address, but will not be limited to: 1) concepts not previously addressed by a SSAP and that do not fit within the scope of an existing SSAP; 2) concepts that fit within the scope of an existing SSAP, but the Working Group elects to supersede existing SSAPs and 3) existing concepts that warrant significant revisions. ~~Substantively revised~~ New SAP concepts to existing SSAPs will be developed to address, but will not be limited to: 1) concepts that fit within the accounting topic of an existing SSAP, but have not been addressed by the Working Group; 2) changes to the valuation and/or measurement of an existing SSAP; and 3) modifications to the overall application of existing SSAPs. The decision to undertake development of a new SSAP or ~~substantively revised~~ a new SAP concept in an existing SSAP will rest with the Working Group. New SSAPs or ~~substantively revised~~ a new SAP concept in an existing SSAPs will have a specified effective date.

5. Research and drafting of a new SSAP or ~~substantially revised~~ a new SAP concept in an existing SSAPs will be performed by NAIC staff under the direction and supervision of the Working Group which may enlist the assistance of interested parties and/or consultants with requisite technical expertise as needed or desired. The first step in developing new SSAPs and ~~substantively revised~~ new SAP concepts in existing SSAPs will commonly be the drafting of an issue paper, which will contain a summary of the issue, a summary conclusion, discussion, and a relevant literature section. Public comments will be solicited on an issue paper (at least one exposure period), and at least one public hearing will be held before the issue paper is converted to a SSAP. Upon approval by the Working Group, all proposed SSAPs will be exposed for public comment for a period commensurate with the length of the draft and the complexities of the issue(s). After a hearing of comments, adoption of new SSAPs or ~~substantively revised~~ new SAP concepts in existing SSAPs (including any amendments from exposure) may be made by simple majority. If no comments are received during the public comment period, the Working Group may

¹ Prior to December 11, 2021, the term used to describe a new SAP concept was “substantive” and the term used to describe a SAP clarification was “nonsubstantive.” The new terms will be reflected in materials to describe revisions to statutory accounting principles on a prospective basis and historical documents will not be updated to reflect the revised terms.

adopt the proposal collectively (one motion/vote) with other non-contested positions after the opportunity is given during the hearing to separately discuss the proposal. All new [SSAPs](#) and ~~substantively revised~~[new SAP concepts in existing](#) SSAPs must be on the agenda for at least one public hearing before presentation to the Task Force for consideration. Adoption by the Task Force, its parent and the NAIC membership shall be governed by the NAIC bylaws.

6. The Working Group may, by a super majority vote (7 out of 10 members, 8 out of 11 or 12, 9 out of 13, 10 out of 14, and 11 out of 15) elect to: 1) combine the IP and SSAP process, resulting in concurrent exposure of the two documents; 2) expose and adopt revisions to a SSAP prior to the drafting/adoption of the related IP; and/or 3) forego completion of an IP and only proceed with [a new SSAP or new SAP concept in an existing](#)~~revisions to a substantively revised~~ SSAP.

7. If accounting guidance, reserving standards, asset valuation standards, or any other standards or rules affecting accounting practices and procedures are first developed by other NAIC working groups, task forces, subcommittees, or committees, such proposed guidance, standards or rules shall be presented to the Working Group for consideration. In cases where such guidance has already been subjected to substantial due process (e.g., public comment periods and/or public hearings), the Working Group may elect to shorten comment periods and/or eliminate public hearings, and in such cases, will notify the Task Force of these actions.

Development of [SAP Clarifications](#)~~Nonsubstantive Revisions to SSAPs~~

8. [SAP clarifications](#)~~Nonsubstantive revisions to SAP~~ will be developed to address, but will not be limited to: 1) clarification of the intent or application of existing SSAPs; 2) new disclosures and modification of existing disclosures; 3) revisions that do not change the intent of existing guidance; and 4) revisions to *Appendix A—Excerpts of NAIC Model Laws* to reflect amendments to NAIC adopted model laws and regulations. Research and drafting of [SAP clarification](#)~~nonsubstantive~~ revisions will be performed by NAIC staff under the direction and supervision of the Working Group. Public comment will be solicited on ~~nonsubstantive~~[these](#) revisions, and the item will be included on the agenda for at least one public hearing before the Working Group adopts ~~nonsubstantive~~—revisions. ~~Nonsubstantive~~[SAP clarification](#) revisions are considered effective immediately after adoption by the Working Group, unless the Working Group incorporates a specific effective date. If comments are not received during the public comment period, the Working Group may adopt the proposal collectively (one motion/vote) with other “non-contested” positions after opportunity is given during the hearing to separately discuss the proposal. At its discretion, the Working Group may request that an issue paper be drafted for ~~nonsubstantive~~[SAP clarification](#) revisions in order to capture historical discussion and adopted revisions. Adoption of ~~nonsubstantive~~[these](#) revisions by the Task Force, its parent and the NAIC membership shall be governed by the NAIC bylaws.

Development of Interpretations to SSAPs and Referencing Interpretations Within SSAPs

[Interpretations Which DO NOT Amend, Supersede or Conflict with Existing SSAPs](#)

9. Interpretations ~~will~~[may](#) be developed to address, ~~but will not be limited to~~ issues requiring timely application or clarification of existing SAP, which shall not amend, supersede or conflict with ~~existing~~[effective](#) SSAPs. Issues being considered as an interpretation must be discussed at no less than two open meetings. (Original introduction of the issue when the Working Group identifies the intent to address the issue as an “interpretation” during a public discussion is considered the first open meeting discussion.) The process must allow opportunity for interested parties to provide comments, but as interpretations are intended to provide timely responses to questions of application or interpretation and clarification of guidance, no minimum exposure timeframe is required.

10. ~~The voting requirement to adopt an interpretation is a simple majority.~~ As [these](#) interpretations do not amend, supersede or conflict with existing SSAP guidance, the interpretation is effective upon

Working Group adoption unless specifically stated otherwise. The voting requirement to adopt an interpretation of this type is a simple majority. The Working Group shall report the adopted interpretation to the Accounting Practices and Procedures (E) Task Force as part of its public report during the next NAIC national meeting (or earlier if applicable). Interpretations can be overturned, amended or deferred ~~only~~ by a two-thirds majority of the Task Force membership. For clarification, a two-thirds majority of the Task Force requires two-thirds of the entire Task Force membership, not just those electing to vote. Additionally, interpretations can be overturned, amended, deferred, or referred to either the Task Force and/or the Working Group by a simple majority of the Financial Condition (E) Committee.

Interpretations Which Amend, Supersede or Conflict with Existing SSAPs

11. In ~~rare~~certain circumstances, such as catastrophes and other time-sensitive issues requiring immediate, temporary statutory accounting guidance, the Working Group may adopt an interpretation which creates new SAP or conflicts with existing SSAPs. Historically, these interpretations temporarily modified statutory accounting principles and/or specific disclosures were developed in response to nationally significant events (e.g., Hurricane Sandy, September 11, 2001). (Examples of time-sensitive issues that have previously provided INT exceptions to SAP include the transition from LIBOR and special situations such as the federal TALF program.) Interpretations that conflict with existing SSAPs shall be temporary and restricted to circumstances arising from the need to issue guidance for circumstances requiring immediate guidance. In order to adopt an interpretation that creates new SAP or conflicts with existing SSAPs, the Working Group must have 67% of its members voting (10 out of 15 members) with a super majority (7 out of 10, 8 out of 11 or 12, 9 out of 13, 10 out of 14, or 11 out of 15) supporting adoption.

a. These interpretations are effective upon Working Group adoption, unless stated otherwise, and shall be reported to the Accounting Practices and Procedures (E) Task Force as part of its public report during the next NAIC national meeting (or earlier if applicable). In circumstances where the Working Group adopts an interpretation (which creates new SAP or conflicts with existing SSAPs) that is controversial in nature (i.e., due to regulator or industry feedback or could have a policy level impact), the Working Group may elect to postpone the effective date until the item has been discussed by the Task Force and the Financial Condition (E) Committee and both have had an opportunity to review the interpretation.

a.b. These interpretations can be ~~adopted,~~ overturned, amended or deferred ~~only~~ by a two-thirds majority of the Task Force membership. For clarification, a two-thirds majority of the Task Force requires two-thirds of the entire Task Force membership, not just those electing to vote. Additionally, interpretations can be overturned, amended, deferred, or referred to either the Task Force and/or the Working Group by a simple majority of the Financial Condition (E) Committee.

12. As new SSAPs are developed, it is essential to review and, if necessary, update the status of interpretations related to SSAPs that are being replaced and/or new SSAPs being developed. The following options are available to the Working Group when a SSAP with existing interpretations is replaced:

- a. **Interpretation of the new SSAP** - If the Working Group would like to maintain the interpretation, the new SSAP can be added to the list of statements interpreted by the interpretation. In addition, the status section of the new SSAP will list the interpretation number next to the heading "Interpreted by."
- b. **Nullification** - When an interpretation is nullified by a subsequent SSAP or superseded by another interpretation, the interpretation is deemed no longer technically helpful, is shaded and moved to Appendix H (Superseded SSAPs and Nullified Interpretations), and

the reason for the change is noted beneath the interpretation title. The status section of the SSAP describes the impact of the new guidance and the effect on the interpretation (for example, nullifies, incorporated in the new SSAP with paragraph reference, etc.).

- c. **Incorporation** - When an interpretation is incorporated into a new SSAP, the Working Group can choose from the following two options:
- i. If the interpretation only interprets one SSAP, then the interpretation is listed as being nullified under the “affects” section of the SSAP and is not referenced under the “interpreted by” section of the status page of the SSAP.
 - ii. If the interpretation references additional SSAPs, and the Working Group intends to maintain the guidance, the interpretation is unchanged (no nullification). The new SSAP (Summary of Issue section) reflects that the interpretation issue has been incorporated into the new statement.

Not for Distribution

NAIC Policy Statement on Comments to GAAP & IFRS Exposure Drafts

1. As expressed in the Statement of Concepts, statutory accounting principles (SAP) utilize the framework established by U.S. Generally Accepted Accounting Principles (GAAP). The NAIC's guidance on SAP (defined in the *Accounting Practices and Procedures Manual*) is comprehensive for those principles that differ from GAAP based on the concepts of statutory accounting. Those GAAP pronouncements that are not applicable to insurance companies will not be adopted by the NAIC. GAAP pronouncements that do not differ from SAP may specifically be adopted by the NAIC to be included in statutory accounting. GAAP pronouncements do not become part of SAP until and unless adopted by the NAIC. Future SAP pronouncements will specifically identify any GAAP pronouncements that are to be included in SAP whether in whole, in part, or with modification as well as any GAAP pronouncements that are rejected. Future GAAP pronouncements, which SAP has not yet addressed, shall not be considered as providing authoritative statutory guidance.
2. As stated in the previous paragraph, the NAIC believes it is important to comment on GAAP exposure drafts that will affect SAP before such guidance is finalized. Exposing potentially contentious issues to the applicable GAAP bodies before completion will create a more efficient and effective maintenance process for the Statutory Accounting Principles (E) Working Group (Working Group). In addition, this allows the NAIC to be proactive to GAAP rather than reactive under the current system. The NAIC also believes that there may be instances in which it is important to comment on exposure drafts of the International Financial Reporting Standards (IFRS). This is particularly important on projects in which U.S. FASB and the International Accounting Standards Board (IASB) are attempting to converge, or to limit differences between U.S. GAAP and IFRS.
3. Comments on exposed GAAP pronouncements or IFRS exposure drafts will be developed at the discretion of the Working Group chair. After a comment letter has been agreed to by the Working Group, the chairs of the Accounting Practices and Procedures (E) Task Force and the Financial Condition (E) Committee must review and approve the comment letter before it is sent to the applicable standard board. Every reasonable attempt will be made to provide an adequate comment period to interested parties; however, FASB and IFRS deadlines may inhibit exposure in every instance. The chairs will consider factors such as comment deadline and level of controversy surrounding the issue. The chair of the parent task force or committee may override such a decision at any time.
4. Comment letters submitted to the FASB on GAAP exposure drafts may be considered when the Working Group is reviewing finalized GAAP pronouncements (as defined in the *NAIC Policy Statement on Maintenance of Statutory Accounting Principles*). Nevertheless, these letters will not bind the Working Group to its tentative position during its deliberation to adopt, modify or reject the final GAAP guidance.

NAIC Policy Statement on Statutory Accounting Principles Maintenance Agenda Process

1. The purpose of this policy statement is to document the Statutory Accounting Principles (E) Working Group (Working Group) maintenance agenda process.

2. As acknowledged in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*, the promulgation of statutory accounting principles (SAP) guidance will be delegated through the NAIC committee structure to the Accounting Practices and Procedures (E) Task Force (Task Force). The Task Force will charge the Working Group with the responsibility to develop and propose new statements of statutory accounting principles (SSAPs), to propose revisions to existing SSAPs, and to issue interpretations in response to questions of application and clarification on existing SSAPs.

3. Information and issues can be presented to the Working Group in a variety of ways. Issues can be recommended or forwarded from 1) other NAIC committees, task forces or working groups; 2) interested parties; 3) interested regulators; and 4) NAIC staff. Also, if any guidance within the Generally Accepted Accounting Principles (GAAP) Hierarchy (see § V of the Preamble to the *Accounting Practices and Procedures Manual* (AP&P Manual)) is added or revised, those changes must be considered by the Working Group for potential revisions to SAP. In order for an issue to be placed on the **Pending Listing**, the recommending party must complete a Statutory Accounting Principles Maintenance Agenda Submission Form (Form A) and submit it to the Working Group support staff no later than 20 business days prior to the next scheduled Working Group meeting. NAIC staff will prepare a submission form for all GAAP pronouncements that have not been previously addressed by the Working Group. NAIC staff will update the **Pending Listing** before each national meeting and will notify the recommending party of such action. If the Working Group does not wish to address the issue (e.g., issue deemed not applicable to statutory accounting) or rejects the position presented, then the Working Group may move the item to the **Rejected Listing**. Should the Working Group choose to address an issue, it is moved to the **Active Listing** where it is prioritized and categorized as a **Substantive**¹, **Nonsubstantive**¹ or **Interpretation** agenda item.

4. The **Active Listing** identifies agenda items that are in the process of development and includes the following:

- a. **Substantive**¹: These agenda items address the development of new SSAPs and substantially revised SSAPs as defined in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*.
- b. **Nonsubstantive**¹: These agenda items address the development of nonsubstantive revisions to SAP as defined in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*.
- c. **Interpretations**: These agenda items address the development of interpretations to SAP as defined in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*. If SSAP revisions are subsequently deemed necessary, the Working Group shall re-categorize the agenda item as either substantive or nonsubstantive¹, as applicable, and follow the appropriate process to consider and adopt revisions.

¹ [Pending Content Alert – Effective January 1, 2022, references to “substantive” and “nonsubstantive,” which have historically been used to describe statutory accounting revisions, have been updated in the NAIC Policy Statement on Maintenance of Statutory Accounting Principles in Appendix F. Accordingly, where applicable, the concept/term, 1\) “substantive” revision is being replaced with the phraseology “new SAP concept” and, 2\) “nonsubstantive” revision is being replaced with the phraseology “SAP clarification” on a prospective basis. At the time of publication of the *As of March 2022 Accounting Practices and Procedures Manual*, conforming editorial revisions which impact the Preamble, Summary of Changes, How to Use this Manual, and NAIC Policy Statement on Statutory Accounting Principles Maintenance Agenda Process were exposed for public comment. When the exposed revisions are adopted, they will be made available as updates to the 2022 AP&P Manual.](#)

5. After review of the agenda item (including any interested party comments), at its discretion, the Working Group makes the ultimate determination of whether an agenda item is categorized (or re-categorized) as substantive (either as a new SSAP or substantively-revised SSAP), nonsubstantive or an interpretation¹.
6. The **Rejected Listing** identifies items that were proposed to the Working Group and rejected without consideration. The **Disposition Listing** includes all agenda items considered by the Working Group and provides the conclusions and guidance given for all adopted revisions to SAP and for all agenda items disposed without modification to SAP.
7. It should be noted that this policy statement addresses the process and the flow of information. The timing is left to the discretion of the Working Group. For instance, once public discussion requirements have been met, as detailed in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*, the Working Group can take action on an item at its discretion. In determining whether it is appropriate to take specific actions (including adoption), the Working Group must consider when the last exposure period occurred, and the extent of any prior comments received and discussions held. Additionally, there is no timeframe in which items must be addressed. Items will remain on the Active Listing until formally disposed of by the Working Group.
8. NAIC staff will maintain the following on the Working Group Web page (https://content.naic.org/cmte_e_app_sapwg.htm): 1) A blank Form A (Attachment A to this policy statement); 2) The current Maintenance Agenda, and 3) Current substantive, nonsubstantive and/or interpretation revisions exposed for public comment. Attachment B to this policy statement will be attached to all exposures with proposed substantive revisions and serves as the request for written comment and notice of a public hearing¹.

Correction of Editorial Errors

9. Over time, during review and publication of the AP&P Manual, NAIC staff may identify inadvertent editorial errors and necessary revisions to the content of the Manual. These are editorial in nature and include grammatical errors, reference changes (i.e., paragraphs, SSAPs, and Model Laws and Regulations) and formatting issues. To aid in correcting these items and improve the overall usefulness of the AP&P Manual, the Working Group has implemented the following process:
 - a. At each meeting of the Working Group, if NAIC staff have identified (or have been informed by interested parties or regulators) any grammatical errors, reference changes and/or formatting issues, NAIC staff will present a public memorandum to the Working Group outlining the proposed amendments to the AP&P Manual. These corrections are not intended to clarify or revise existing guidance and as such, do not ordinarily warrant the use of a Form A or addition to the Maintenance Agenda.
 - b. After presentation to the Working Group, the memorandum will be exposed for a public comment period. If no objections are raised by the Working Group, interested regulators or interested parties, the revisions will be considered “noncontested” and presented to the Working Group for adoption. Upon adoption, the revisions will be incorporated into the AP&P Manual, with the revisions being posted on the “Updates to the AP&P Manual” secure Web page. Under this process, these revisions will be shown as tracked changes to the Manual unless otherwise noted in the memorandum.
 - c. If objections are raised by the Working Group, interested regulators or interested parties, the proposed revisions will either be rejected without further discussion or incorporated into a Form A to be presented to the Working Group and subsequently exposed for a public comment period. Under this process, the revisions will follow the Maintenance Agenda process as outlined in this policy statement.

EXPOSURE DRAFT NUMBER - TITLE

Notice of Public Hearing and Request for Written Comments

Hearing Date: _____

Location: _____

Deadline for Written Notice of Intent to speak: _____

Deadline for Receipt of Written Comments: _____

Basis for hearings. The Statutory Accounting Principles (E) Working Group (Working Group) will hold a public hearing to obtain information from and views of interested individuals and organizations about the standards proposed in this Exposure Draft. The Working Group will conduct the hearing in accordance with the *National Association of Insurance Commissioners (NAIC) Policy Statement on Open Meetings*. An individual or organization desiring to speak must notify the NAIC in writing by _____. Speakers will be notified as to the date, location and other details of the hearings.

Oral presentation requirements. The intended speaker must submit a position paper, a detailed outline of a proposed presentation or comment letter addressing the standards proposed in this Exposure Draft by _____. Individuals or organizations whose submission is not received by this date will only be granted permission to present at the discretion of the Working Group chair. All submissions should be addressed to NAIC staff at the address listed below. Comments can also be submitted by electronic mail to _____@naic.org.

Format of hearings. Speakers will be allotted up to 10 minutes for their presentations to be followed by a period for answering questions from the Working Group. Speakers should use their allotted time to provide information in addition to their already submitted written comments as those comments will have been read and analyzed by the Working Group. Those submissions will be included in the public record and will be available at the hearings for inspection.

Copies. Exposure drafts can be obtained on the Working Group's Web page at https://content.naic.org/cmt_e_app_sapwg.htm.

Written comments. Participation at a public hearing is not a prerequisite to submitting written comments on this Exposure Draft. Written comments are given the same consideration as public hearing testimony.

The Statutory Accounting Principles Statement of Concepts was adopted by the Accounting Practices & Procedures (EX4) Task Force on September 20, 1994, in order to provide a foundation for the evaluation of alternative accounting treatments. All issues considered by the Working Group will be evaluated in conjunction with the objectives of statutory reporting and the concepts set forth in the Statutory Accounting Principles Statement of Concepts.

The exposure period is not meant to only measure support for, or opposition to, a particular accounting treatment but rather to accumulate an analysis of the issues from other perspectives and persuasive comments supporting them. Therefore, form letters and objections without valid support for their conclusions are not helpful in the deliberations of the Working Group. Comments should register agreement or disagreement with a detailed explanation, a description of the impact of the proposed guidelines, and possible alternative recommendations for accomplishing the regulatory objective.

Any individual or organization may send written comments to _____ by electronic mail in Microsoft Word format to _____@naic.org. After written comments have been reviewed by the Working Group, the letters will be posted publicly on the NAIC website.

NAIC Policy Statement on the Impact of Statements of Statutory Accounting Principles on NAIC Publications

1. The purpose of this policy statement is to document the process and procedure for identifying the impact of statements of statutory accounting principles (SSAPs) on NAIC publications.
2. New and revised SSAPs can affect various NAIC publications in different ways. New accounting practices or procedures may result in new disclosures and reporting requirements (affecting annual statement blanks and instructions), modified analysis techniques (affecting RBC formula or IRIS ratios), or new examination procedures (affecting the *Financial Condition Examiners Handbook*).
3. The Statutory Accounting Principles (E) Working Group (Working Group) shall evaluate the impact that newly adopted SSAPs will have on other NAIC publications. To that end, the Working Group shall submit a referral to any group in response to new or revised SSAPs expected to impact other NAIC groups or publications. (Instead of a referral, a blanks proposal may be sponsored by the Working Group and submitted to the Blanks (E) Working Group). These referrals and blanks proposals are only required to be approved by the chair of the Working Group prior to submission to the other groups but may be shared with and approved by all Working Group members.

Not for Distribution

NAIC Policy Statement on Coordination of the Accounting Practices and Procedures Manual and the Annual Statement Blank

1. The purpose of the codification of statutory accounting principles (SAP) project was to produce a comprehensive guide to SAP for use by insurance departments, insurers, and auditors. Statutory accounting principles, as they existed prior to codification did not always provide a consistent and comprehensive basis of accounting and reporting. Insurance companies were sometimes uncertain about what rules to follow and regulators were sometimes unfamiliar with the accounting rules followed by insurers in other states. This was due in part to the fact that prior to codification, accounting guidance could be found in the NAIC *Accounting Practices and Procedures Manual*, annual statement instructions, the *Financial Condition Examiners Handbook*, and various states' laws and regulations. As a result, insurers' financial statements were not prepared on a comparable basis. Now that accounting requirements have been more rigidly stipulated by the NAIC, it is imperative that the accounting requirements and the reporting and disclosure requirements remain synchronized. This is an excellent opportunity to create a system of parallel requirements. This effort has already been recognized by the NAIC/AICPA (E) Working Group. In 1999, the NAIC/AICPA (E) Working Group modified the *Model Regulation Requiring Annual Audited Financial Reports* to require the following for audited financial statements:

Notes to financial statements. These notes shall be those required by the appropriate NAIC annual statement instructions and the NAIC *Accounting Practices and Procedures Manual*. The notes shall include a reconciliation of differences, if any, between the audited statutory financial statements and the annual statement filed pursuant to Section [insert applicable section] of the [insert state] insurance law with a written description of the nature of these differences.

2. As stated in the model regulation, the NAIC/AICPA (E) Working Group has an expectation that the requirements of the annual statement instructions and the *Accounting Practices and Procedures Manual* will be identical in all pertinent parts that are subject to audit. There is no reason to create a different set of audit requirements in the annual statement instructions when a complete and comprehensive guide to statutory accounting exists. However, it must be noted that the statements of statutory accounting principles (SSAPs) are not intended to prescribe the specific format of the detailed financial statements.

3. The scope of this policy statement is defined as follows:

Any change to the annual statement core financials (balance sheet, income statement, cash flow and notes to the financial statements) must be reviewed by the Statutory Accounting Principles (E) Working Group to determine whether it conflicts with the disclosure requirements of the SSAPs.

4. The scope is defined in broad terms because it is very difficult to specify what constitutes a conflict with the SSAPs. For example, the renumbering of the assets page does not conflict because there is not a SSAP that prescribes the order of asset presentation. Contrast this with a seemingly innocuous proposal to modify Schedule P - Part 1 that would create a disclosure conflict with the related SSAP.

5. In order to ascertain that the requirements of the annual statement instructions and blank are in harmony with the SSAPs (as they relate solely to the core financial statements), the following procedures shall be followed:

- a. The Blanks Agenda Item Submission Form will include an interrogatory that will indicate to the Blanks (E) Working Group whether the proposal:
 - i. Affects the core financial statements

- ii. Conflicts with an existing SSAP
 - iii. Is not currently required by a SSAP
 - iv. Has been reviewed by the Statutory Accounting Principles (E) Working Group
- b. NAIC staff supporting the Statutory Accounting Principles (E) Working Group and the Blanks (E) Working Group are charged with verifying the accuracy of the interrogatory proposed in paragraph 5.a.. After NAIC staff review the proposals, they will report their findings back to the applicable groups. If NAIC staff identify issues that need further exploration or consultation, the chairs of the two working groups or certain members from each group will hold a joint meeting.
- c. The Blanks (E) Working Group will reject proposals that will delete/modify information contained within the core financial statements that are required by an existing SSAP.
- d. The Blanks (E) Working Group will either reject proposals that would require additional audited disclosure or audited information within the core financial statements if that same item is not required by an existing SSAP; or move it outside the core financial statements. The sponsoring party will still have the option of placing this information outside the core financial statements (e.g., general interrogatories or interrogatories to schedules) until the disclosure is included in a SSAP. If the disclosure were added to a SSAP in the future, it could be moved to the Notes to the Financial Statements and subject to audit at that time.
- e. The NAIC will maintain a SSAP to annual statement cross-reference. This cross-reference will contain two significant features. First, it will list all of the SSAP disclosures and reference them to where in the annual statement the disclosure requirement is met. Second, the cross-reference will identify the annual statement components that are required by a SSAP. The cross-reference can be used by the Blanks (E) Working Group and interested parties in completing the new Blanks Agenda Item Submission Form Interrogatory.

NAIC Policy Statement on Coordination with the Valuation Manual

1. Proposed changes to the *Valuation Manual* must be consistent with the existing referenced model laws, including the *Standard Valuation Law* (Model #820), and, to the extent determinable, with models in development. To the extent that proposed changes to the *Valuation Manual* could have an impact on accounting and reporting guidance and other requirements as referenced by the *Accounting Practices and Procedures Manual*, proposed changes must be reviewed by the Statutory Accounting Principles (E) Working Group for consistency with the *Accounting Practices and Procedures Manual*, including consistency of implementation dates. The Life Actuarial (A) Task Force or its staff support will prepare a summary recommendation that will include as appropriate an analysis of the impact of proposed changes.

2. If the Statutory Accounting Principles (E) Working Group reaches the conclusion that the proposed changes to the *Valuation Manual* are inconsistent with the authoritative guidance in the *Accounting Practices and Procedures Manual*, The Life Actuarial (A) Task Force will work with the Statutory Accounting Principles (E) Working Group to resolve such inconsistencies prior to implementation.

Not for Distribution

NAIC Policy Statement on Coordination of the Accounting Practices and Procedures Manual and the Purposes and Procedures Manual of the NAIC Investment Analysis Office

1. The purpose of this policy statement is to detail the coordination and collaboration between the Securities and Valuation Office (SVO) and the Statutory Accounting Principles (E) Working Group (Working Group) support staff, the relationship between the *Purposes and Procedures Manual of the NAIC Investment Analysis Office* (P&P Manual) and *Accounting Practices and Procedures Manual* (AP&P Manual) and the expectations of the Valuation of Securities (E) Task Force (VOSTF) and the Working Group.

NAIC Designations Do Not Communicate Statutory Accounting or Reporting

2. The assessment of credit risk for an obligation or asset, as specified in the P&P Manual, is a separate and distinct process from the determination of statutory accounting or reporting under the AP&P Manual. The manner in which an NAIC designation is used within statutory accounting guidance is limited to that, if any, specified in a statement of statutory accounting principle (SSAP) and cannot be derived or implied by language in the P&P Manual. Obtaining an NAIC designation does not change an investment's applicable SSAP, annual or quarterly statement reporting schedule, or override other SSAP guidance required for the investment to be an admitted asset. There are limited instances in which a SSAP specifically identifies, within its scope, the inclusion of specific SVO-identified investments. The SVO review required for an investment to be included on a SVO listing is a separate evaluation process that focuses on the structure of the investment. This process is distinct from the SVO's assessment of an investment's credit risk, which results in a NAIC designation. As stated in the Statutory Hierarchy, Section V of the Preamble, the AP&P Manual is the highest level of authoritative guidance.

Sources and Application of Statutory Accounting Guidance

3. The authority to determine and interpret existing statutory accounting guidance in, or to develop new statutory accounting guidance for, the AP&P Manual, is a charge assigned by the Financial Condition (E) Committee through its Accounting Practices and Procedures (E) Task Force to the Statutory Accounting Principles (E) Working Group. The application of statutory accounting guidance to any specific obligation or asset to determine its status under the AP&P Manual is the obligation of the insurance company and its management. The state of domicile is the final authority with respect to statutory accounting and reporting guidance. Deviations from the authoritative guidance in the Statutory Accounting Hierarchy are reflected as a permitted or prescribed practice.

Impact on SVO Operations

4. Because SVO analytical determinations of credit quality do not convey opinions, conclusions or informational content relative to statutory accounting status, the SVO may assign an NAIC designation to any obligation or asset that is filed by an insurer, provided that its credit quality can be assessed consistently with the policies and methodologies specified in the P&P Manual.

Communication and Coordination Between SVO and SAPWG Staff

5. The following processes are intended to assist optimum communication and coordination between the SVO and SAPWG support staff functions.

- a. Maintain ongoing dialogue regarding investments, investment related SSAPs and relevant developments in the areas assigned to support staff of both groups.

- b. Maintain an ongoing dialogue relative to obligations and assets filed with the SVO, including communications about new types of obligations or assets filed with the SVO and their likely treatment under existing investment related SSAPs.
- c. Maintain an ongoing dialogue relative to new obligations or assets, in which no statutory accounting guidance exists, or uncertainty exists about how current statutory accounting guidance applies to features or characteristics of the obligation or asset.
- d. The NAIC Investment Analysis Office (IAO) and Financial Regulatory Services (FRS) staff shall provide notice to, and consult with, each other when either staff determines that existing technical guidance or procedures administered by the staff are no longer adequate to secure the original regulatory objective for which it was designed. Upon receipt of such notice, both staff will formulate a statement of the issues and, if possible, recommendations, and thereafter coordinate discussion between the SAPWG and the VOSTF consistent with the NAIC procedures and policies that apply to the situation. Such proposed recommendations shall be discussed consistent with the NAIC open meetings policy and any revisions to the authoritative guidance will be exposed for comment for a period of time commensurate with the significance of the change, to provide a formal forum for interested parties and regulators to provide input and allow for adequate due process.
- e. Situations in which NAIC staff (SVO or FRS) are contacted directly with questions on statutory accounting application, it shall be noted that opinions of NAIC staff are not authoritative and are based on the information provided and existing authoritative statutory accounting guidance. Information and issues can be submitted to the SAPWG for consideration, as detailed in the *NAIC Policy Statement on Statutory Accounting Principles Maintenance Agenda Process*.

Implementation Guide for the Annual Financial Reporting Model Regulation

Introduction

The new requirements within the Annual Financial Reporting Model Regulation (Model) related to auditor independence, corporate governance and internal control over financial reporting became effective in 2010. The Implementation Guide (Guide) is being published to assist companies in planning and preparing for compliance with the new requirements.

The Guide is intended to supplement the Model, not to create additional requirements, by providing interpretive guidance and clarifying the meaning of terms used in the Model. Such guidance is important to ensure common understanding between insurers and regulators and to memorialize the intent of the changes. Because issues and questions will occur from time-to-time, by placing the Guide outside of the Model, maintenance can be achieved in a cost-effective way without reopening the Model especially when the issue under consideration is an interpretation of the requirements. The Guide should not be viewed as a requirement of complying with the *Accounting Practices and Procedures Manual*.

Maintaining the Guide

The responsibility of developing and maintaining the Guide resides with the NAIC/AICPA (E) Working Group with changes to the Guide following the NAIC regulatory due process. The Guide resides as an informational appendix to the NAIC *Accounting Practices and Procedures Manual* (AP&P Manual). The AP&P Manual was selected as the logical repository since the Guide provides instruction about compliance with the Model, which directly relates to financial reporting and statutory accounting.

The regulatory due process for modifying this Guide requires the NAIC/AICPA (E) Working Group to send adopted proposals to the Accounting Practices and Procedures (E) Task Force for adoption and inclusion in the AP&P Manual. If the Accounting Practices and Procedures (E) Task Force recommends substantive changes to the proposal received from the NAIC/AICPA (E) Working Group, the proposal should be returned to the NAIC/AICPA (E) Working Group for further deliberation.

Table of Contents

The Table of Contents for the Guide mirrors that of the Model. However, not all sections of the Model require interpretive guidance. Consequently, only those sections containing guidance are contained in the Guide. The presentation of the Guide is organized by the section title with the section number of the Model appearing after the title.

Requirements for Audit Committees	14	11
Management's Report of Internal Control over Financial Reporting	17	13
Exemptions and Effective Dates	18	18
Appendix 1	17	22

Definitions (Section 3)

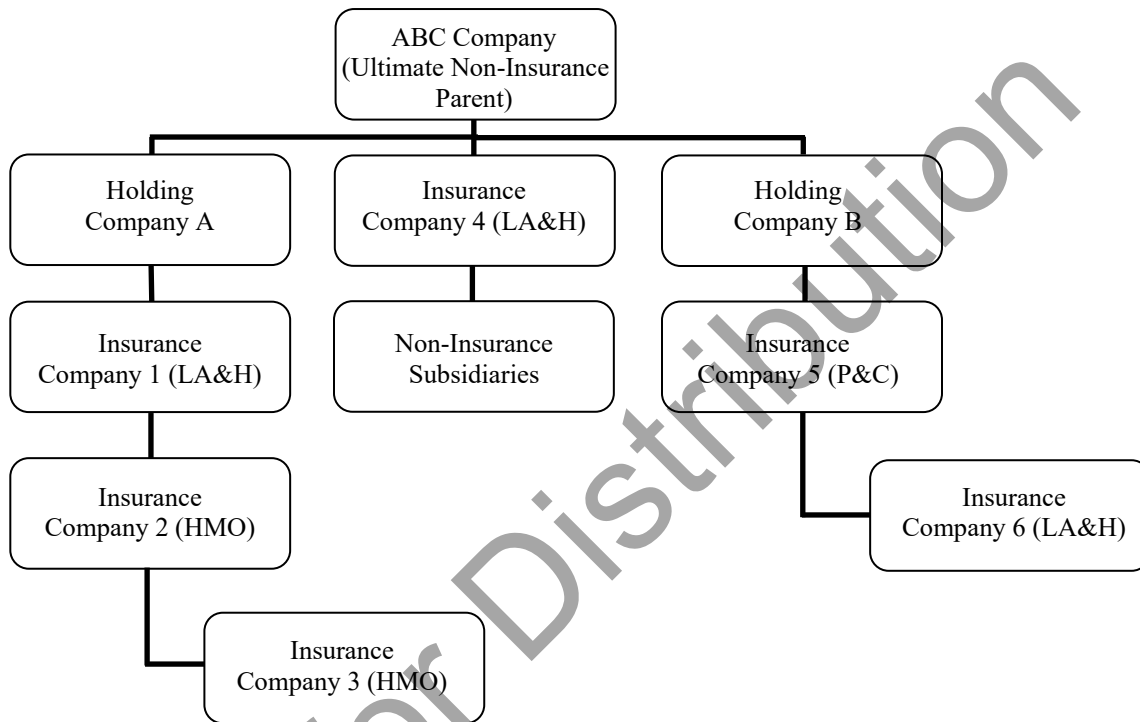

Certain terms and definitions contained in the Model need no further explanation. The Guide provides additional information for preparers and users for some definitions to facilitate their understanding.

“Audited financial report” (D), differs from the term “financial statements” in that the Audited financial report (see Section 5 of the Model) includes the financial statements plus the report of the independent certified public accountant. “Financial statements,” therefore, excludes the report of the independent certified public accountant.

“Group of insurers” (H), as intended for use in the Model is to recognize the variety of structures that may exist. Companies within a holding company structure, or other set of insurers identified by management, may often share common management, systems or processes. Consequently, when management asserts to the effectiveness of their internal controls, it is appropriate to make such an assertion for those companies based upon the organization management determines to be most relevant to meet the reporting requirements. Because holding company structures, and other groups of insurers, can be complex and organized to meet corporate objectives, that structure may not align with the organizations that are responsible for managing and preparing the financial statements of the insurer. The Model provides flexibility to insurers to identify a “Group of insurers” for purposes of evaluating the effectiveness of their internal control over financial reporting. In determining the appropriate scope and level of testing for systems that are shared by a group of insurers, management is not required to expand the scope or perform additional testing that would be redundant for each legal entity included within the group of insurers. To the extent that a specific internal control or system is unique to and has a material impact on the preparation of the audited statutory financial statements of a legal entity included in a group of insurers and the legal entity exceeds the premium thresholds contained in Section 17, that control or system is to be included in management's evaluation of internal controls.

A “Group of insurers” that has been granted approval to file audited statutory consolidated or combined financial statements of a group of insurers (as described in Section 8) may set the scope and level of testing for purposes of determining effectiveness of internal controls over financial reporting consistent with the basis on which the audited statutory financial statements for the Group are prepared (i.e., at the combined or consolidated level).

The following example is intended to illustrate various ways that a “Group of insurers” could be determined. The example is not intended to be limiting in any way. Rather, it is intended to show the flexibility to be in compliance with the Model. Insurers are encouraged to notify the Commissioner of its initial “Group of insurers” and any subsequent changes to such group.

1. “Group of insurers” could be established at the ultimate parent level, i.e., one report of the effectiveness of internal controls for all insurers in the group—insurance companies 1-6.
2. Two “Group of insurers” could be established at the holding company level, i.e., holding company A and B. In this case, a separate report would be required for holding company A, holding company B, and if it met the reporting threshold, insurance company 4 since it is not in either group.
3. Two “Group of insurers” could be established based upon the type of insurance company, i.e., LA&H companies 1, 4 and 6 could be one group and HMO companies 2 and 3 in the second group. In this case, a separate report would be required for the LA&H companies, the HMO companies and if it met the reporting threshold, insurance company 5 since it is not in either group.
4. Two “Group of insurers” could be established based upon the way the entities are managed. For example, companies, 1, 2, 3 and 5 have the same management while companies 4 and 6 have common management.
5. If management elects not to identify a “Group of insurers” for purposes of evaluating the effectiveness of internal control over financial reporting then each reporting entity meeting the reporting requirements of Section 17 would prepare such a report.

“Internal control over financial reporting” (I), as defined in the Model is intended to have the same meaning as understood in the public sector to comply with the requirements of the Sarbanes-Oxley Act of 2002. Because some terms might not be fully defined and to avoid misunderstanding, this Guide attempts to clarify such terms. For example, the word “reliability” used in the phrase “reliability of financial statements” has the same meaning as that contained in the generally accepted accounting principles (GAAP) framework, Statement of Financial Accounting Concepts Two. This Statement is referenced in the Preamble, Part III, paragraph 24 of the AP&P Manual.

General Requirements Related to Filing and Extensions for Filing of Annual Audited Financial Reports and Audit Committee Appointment (Section 4)

Section 4D stipulates that each insurer required to file an annual Audited financial report pursuant to the Model shall designate a group of individuals as constituting its Audit committee. Section 4D further states that the Audit committee of an entity that controls an insurer may be deemed to be the insurer’s Audit committee for purposes of this regulation at the election of the controlling person. The definition of Audit committee in Section 3 of the Model references Section 14E for exercising this election. However, a disclaimer within Section 14 of the Model indicates that the section shall not apply to SOX Compliant Entities or wholly-owned subsidiaries of SOX Compliant Entities. Regardless of the disclaimer, in order to comply with the second sentence in Section 4D, the Audit committee of any entity that controls an insurer (a SOX Compliant entity or a non-SOX Compliant Entity) may be deemed to be the insurer’s Audit committee at the election of the controlling person, and only if such election is completed in the manner outlined in Section 14E.

The responsibility of the Audit committee is defined in Section 14 of the Model. Section 14 states that each member of the Audit committee shall be a member of the Board of Directors and sets forth the requirements for the proportion of independent Audit committee members based on the insurer’s direct written and assumed premiums. The definition of an independent Audit committee member is outlined in Section 14.

Qualifications of Independent Certified Public Accountant (Section 7)

Lead Audit Partner Rotation Requirement (Section 7D)

Purpose

The purpose of this section is to provide companies and their independent accountants with guidance to enable an orderly transition in meeting the revised lead audit partner rotation requirements as set forth in Section 7.

Background

Section 7 provides certain limitations on the number of years an audit partner may serve in the capacity of lead audit partner for an insurance company audit. Previously, the lead audit partner was permitted to serve for seven consecutive years in that capacity with a two year break in service. Under the revised Model “...the lead ...audit partner (having primary responsibility for the audit) may not act in that capacity for more than five (5) consecutive years. The person shall be disqualified from acting in that or a similar capacity for the same company or its insurance subsidiaries or affiliates for a period of five (5) consecutive years.”

The new rotation requirements under Section 7 are effective beginning with audits of the 2010 financial statements. The rotation requirements of the Model and the interpretative guidance provided are applicable for statutory reporting and regulatory purposes. An insurer and its affiliates that are subject to the rotation requirements of the Securities and Exchange Commission (SEC) and Public Company Accounting Oversight Board (PCAOB) must also continue to comply with those rotation requirements.

Relief from the Lead Audit Partner Rotation Requirement (Section 7D)

The Model states:

An insurer may make application to the Commissioner for relief from the above rotation requirement on the basis of unusual circumstances. This application should be made at least thirty (30) days before the end of the calendar year. The Commissioner may consider the following factors in determining if the relief should be granted:

- (a) Number of partners, expertise of the partners or the number of insurance clients in the currently registered firm;
- (b) Premium volume of the insurer; or
- (c) Number of jurisdictions in which the insurer transacts business.

The following examples illustrate circumstances that the Commissioner may consider in determining if relief from the lead partner rotation requirement shall be granted:

1. No other partners in the firm's local office have the qualifications to serve as lead audit partner and the use of a qualified partner resident in another location could result in increased audit risk and higher audit fees.
2. Limited number of partners in the firm that have the qualifications to serve as the lead audit partner.
3. Switching firms could result in increased audit risk due to the new engagement team's lack of familiarity with the insurer.
4. Limited availability of other firms in a particular location with the requisite expertise.
5. The regulator believes that complex issues at an insurer make a particular partner best suited to continue as lead audit partner
6. Short-term relief due to the occurrence of an unforeseeable event that renders a partner unable to continue as the lead audit partner on the engagement.
7. Short-term relief due to unexpected delays in the state's licensing or admission process that prevent the "new" lead audit partner from assuming that role.

Also, the granting of transitional relief may be warranted when the non-insurance parent or ultimate parent of an insurance company is an SEC registrant and the current lead audit partner on the SEC registrant has completed his or her rotation as the lead audit partner on insurance subsidiaries prior to completing his or her five-year rotation as the lead partner on the audit of the GAAP financial statements of the SEC registrant. In this situation the relief would allow the lead audit partner to complete his or her rotation on the SEC registrant as long as he or she no longer acts in the capacity of lead audit partner for any insurance subsidiaries and/or any downstream affiliates of the insurance subsidiaries.

Frequently Asked Questions (Section 7D)

Following are a series of frequently asked questions to assist companies and their independent accountants in interpreting this guidance. Dates provided refer to the year of financial statements under audit.

In determining when the lead audit partner must rotate, consecutive time served in the capacity of lead audit partner prior to the effective date of these rules would be counted (i.e., the lead audit partner is not

afforded a “fresh start”). If the lead audit partner completed the two year break in service required by the previous version of the Model prior to the effective date of these rules, the partner is eligible to resume service as a lead audit partner for a five year period and need not wait additional years to accomplish a five year break in service.

1. 2010 would be the fifth year that a partner would serve as lead audit partner of an insurance company. Would that partner be able to complete the 2010 year-end audit?

Yes. The partner would be able to complete the 2010 year-end audit; however, the partner would be required to rotate off the engagement after the 2010 year-end audit.

2. 2010 would be the sixth or seventh year that a partner would serve as the lead audit partner. Would that partner be able to serve in that capacity for the 2010 audit?

No. The partner would be required to rotate off for the 2010 year-end audit. In determining when the lead audit partner must rotate, consecutive time served in the capacity of lead audit partner since the most recent two year break in service prior to the effective date of these rules would be counted.

3. If a partner serves as the concurring partner from 2007 – 2010, can that partner serve as the lead audit partner in 2011? If so, for how many years?

Yes. The Model does not prohibit a partner that has served as the concurring partner from subsequently serving as the lead audit partner. The time served as concurring partner does not count towards the five year limitation. In the situation above, the partner would be permitted to serve as lead audit partner from the 2011 year-end audit through the 2015 year-end audit.

4. Can a lead audit partner serve as the concurring review partner during the required five year break in service?

Yes. The Model specifies that a partner may not act in “that or a similar capacity for the same company or its insurance subsidiaries or affiliates for a period of five (5) consecutive years” where “that” refers to the role of lead audit partner. Therefore, the Model does not prohibit that partner from serving as concurring partner during that partner’s five year break in service.

5. During the five-year break in service, can a partner serve as lead audit partner on an insurance company affiliate of that company?

No. The Model specifies a “person shall be disqualified from acting in that or a similar capacity for the same company or its insurance subsidiaries or affiliates for a period of five (5) consecutive years.” The phrase “insurance subsidiaries or affiliates” is interpreted to mean any subsidiaries and affiliates (whether insurance or non-insurance).

6. If a lead audit partner serves for six years prior to the effective date of the revised Model (year-end audits from 2003 – 2008) then rotates off the engagement for two years (year-end audits 2009 – 2010), can that partner serve for five additional consecutive years (year-end audits from 2011 – 2015) as the lead audit partner?

No. The requirement for a break in service of five consecutive years becomes effective for the 2010 year-end audits. If the partner has not completed the two-year break in service prior to the effective date of the new requirement, the partner becomes subject to the new requirement and must complete a five-year break in service. However, if the lead audit partner completes the two year break in service by 2009 instead of 2010, that partner would be permitted to resume the lead audit partner role in 2010.

7. A partner that served seven years as lead audit partner has not worked on the engagement for two years. Assuming 2010 otherwise would be year three of the break in service, can that partner assume the lead audit partner role for the 2010 year-end audit?

Yes. The requirement for the five year break in service starts with engagement years beginning 2010. Prior to 2010, the rotation requirement is for a two year break in service.

8. If a lead audit partner served in that capacity for years 2007 – 2009 and was not on the engagement (or that of any subsidiary or affiliate) for 2010, would that partner have to complete a five year break in service before again serving as the lead audit partner?

No. However, the partner could only serve as the lead audit partner for two more years since the partner has already served three years on this engagement.

9. Can a former lead audit partner currently in a break in service continue to serve the client in a role other than the lead audit partner, for example concurring partner or auxiliary partner, such as tax review partner or other assisting role?

Yes. The Model auditor rotation rules apply only to the role of lead audit partner on the audit of the insurance company and its insurance subsidiaries or affiliates.

10. 2010 is the first year that a partner serves as the lead audit partner on an insurer. The partner serves as the lead audit partner on that insurer for year-end audits of 2010 – 2012; however, during 2013 – 2015 that partner does not serve as the lead audit partner on that insurer or any of its affiliates. If that partner again serves the insurer (or any of its insurance subsidiaries or affiliates) as the lead audit partner for 2016 year-end audit, when must that partner rotate off the engagement?

The partner is permitted to serve as the lead audit partner for the 2016 and 2017 year-end audits and must begin a five-year break in service with the year-end 2018 audit. The break in service during 2013 – 2015 would be for less than the five-year period required by the Model. In order for the partner to be permitted to begin a new five-year service period as lead audit partner on the insurer or any of its insurance subsidiaries or affiliates, a full five-year break in service is required to be completed by that partner.

11. How is service as the lead audit partner on the audit of the GAAP-basis financial statements of a separate account evaluated under the Model?

A separate account is not a legal entity, but an accounting entity with accounting records for variable contract assets, liabilities, income, and expenses segregated as a discrete operation within the insurance company. Therefore, the separate account is considered to be an insurance affiliate for purposes of applying the Model.

If the insurer is a part of a mutual fund complex, the mutual funds are considered to be non-insurance affiliates even if held as investments in the insurer's separate accounts.

12. An insurer changes to a new independent accounting firm. At the same time, the lead audit partner for that insurer joins the new independent accounting firm. Would the lead audit partner's time at the previous accounting firm count toward the five year rule at the new accounting firm?

Yes. The rule specifically applies to the lead audit partner and not the independent accounting firm.

13. Some firms have individuals that are CPAs but not partners (i.e., nonequity participants such as directors or principals) that serve in the role of the lead audit partner. Can such a CPA serve in the role of the lead audit partner of an insurance company?

Yes. The Model defines the lead audit partner as the individual having “primary responsibility for the audit.” Whether this capacity is served by a partner or other CPA with the equivalent qualifications is at the discretion of the independent accounting firm. As such, the individual would be subject to the rotation requirements of the lead audit partner under Section 7.

Questions 14 through 23 are based on the following hypothetical fact pattern and assume there are no public registrants in the group.

Neither insurance subsidiary A nor insurance subsidiary B has any investment in non-insurance subsidiary C.

- Partner Smith served as the lead audit partner on non-insurance holding company H for six years through the 2010 year-end audit.
- Partner Jones served as the lead audit partner on insurance subsidiary A for four years through the 2010 year-end audit.
- Partner Little served as the lead audit partner on insurance subsidiary B for three years through the 2010 year-end audit.
- Partner Brown served as the lead audit partner on non-insurance subsidiary C for two years through the 2010 year-end audit.
- Partner Miller served as the lead audit partner on insurance subsidiary D for three years through the 2010 year-end audit.
- Partner King served as the lead audit partner on non-insurance subsidiary E for seven years through the 2010 year-end audit.

14. Can Partner Smith rotate from serving as the lead audit partner on non-insurance holding company H to serving as the lead audit partner on insurance subsidiary B for the 2011 year-end audit?

Yes. The limitation under Section 7 initiates with service as the lead audit partner of an *insurer*. Assuming Partner Smith has not previously served as the lead audit partner on an insurer, he or she can then serve as the lead audit partner on insurance subsidiary B or any of its affiliates for up to five years.

15. Can Partner King rotate from serving as the lead audit partner on non-insurance subsidiary E to serving as the lead audit partner on insurance subsidiary B for the 2011 year-end audit?

Yes. The limitation initiates with service as the lead audit partner of an *insurer*. Assuming Partner King has not previously served as the lead audit partner on an insurer, he or she can then serve as the lead audit partner on insurance subsidiary B or any of its affiliates for up to five years.

16. Can Partner Brown rotate from serving as the lead audit partner on non-insurance subsidiary C to serving as lead audit partner on insurance subsidiary B for the 2011 year-end audit?

Yes. The limitation initiates with service as the lead audit partner of an *insurer*. Assuming Partner Brown has not previously served as the lead audit partner on an insurer, he or she can then serve as the lead audit partner on insurance subsidiary B or any of its affiliates for up to five years. Therefore, Brown could serve insurance subsidiary B for five years beginning with the 2011 year-end audit.

17. Can Partner Brown rotate from serving as the lead audit partner on non-insurance subsidiary C to serving as lead audit partner on Holding Company H for the 2011 year-end audit?
- Yes. C is a non-insurance subsidiary and H is a non-insurance holding company; therefore, assuming Partner Brown has not previously served as the lead audit partner on an insurer, the partner rotation requirements of Section 7 are not applicable relative to non-insurance subsidiary C and non-insurance holding company H.
18. Can Partner Jones rotate from serving as the lead audit partner on insurance subsidiary A to serving as the lead audit partner for insurance subsidiary B for the 2011 year-end audit?
- Yes. However, Jones can only serve for one year due to four years prior service as the lead audit partner on insurance subsidiary A (an insurance affiliate).
19. Can Partner Jones rotate from serving as the lead audit partner on insurance subsidiary A to serving as the lead audit partner on non-insurance subsidiary C for the 2011 year-end audit?
- Yes. However, Jones can only serve for one year due to four years prior service as the lead audit partner on insurance subsidiary A (an insurance affiliate). The limitation initiates with serving as the lead audit partner on an insurer.
20. Can Partner King rotate from serving as the lead audit partner on non-insurance subsidiary E to serving as the lead audit partner on non-insurance subsidiary C for the 2011 year-end audit?
- Yes. E is a non-insurance subsidiary and C is a non-insurance subsidiary; therefore, assuming Partner King has not previously served as the lead audit partner on an insurer, the partner rotation requirements of Section 7 are not applicable relative to non-insurance subsidiary E and non-insurance subsidiary C.
21. Can Partner Jones rotate from serving as the lead audit partner on insurance subsidiary A to serving as the lead audit partner on non-insurance subsidiary E for the 2011 year-end audit?
- Yes. However, Jones can only serve for one year due to four years prior service as the lead audit partner on insurance subsidiary A (an insurance affiliate). The limitation initiates with serving as the lead audit partner on an insurer.
22. Can Partner Jones rotate from serving as the lead audit partner on insurance subsidiary A to serving as the lead audit partner on insurance subsidiary D for the 2011 year-end audit?
- Yes. However, Jones can only serve for one year due to four years prior service as the lead audit partner on insurance subsidiary A (an insurance affiliate). The limitation initiates with serving as the lead audit partner on an insurer.
23. Can Partner Little rotate from serving as the lead audit partner on insurance subsidiary B to serving as the lead audit partner on non-insurance subsidiary E for the 2011 year-end audit?
- Yes. However, Little can only serve for two years due to three years prior service as the lead audit partner on insurance subsidiary B (an insurance affiliate). The limitation initiates with serving as the lead audit partner on an insurer.

Prohibited Services (Section 7 G)

The Model does not allow the Commissioner to accept an Audited financial report prepared by an accountant who provides the insurer, contemporaneously with the audit, non-audit services as outlined within the Model. One of the prohibited services outlined in the Model consists of bookkeeping or other services related to the accounting records or financial statements of the insurer. The prohibition in this area should include, but is not limited to, services related to the preparation of the Annual Statement to be submitted by the insurer. However, the drafting of the Audited financial report would not be prohibited, provided that the accountant does not assume decision-making authority (e.g., approval of journal entries) in compiling the draft report.

Communication of Internal Control Related Matters Noted in an Audit (Section 11)

In addition to the annual Audited financial report, each insurer must furnish the Commissioner with a written communication as to any unremediated material weakness in its internal control over financial reporting noted during the audit. The communication is prepared by the accountant within 60 days after the filing of the annual Audited financial report and is filed by the insurer. Recognizing it may not always be practical, insurers are encouraged to file the communication concurrently with the filing of the annual Audited financial report for those years in which the insurer is aware that a financial condition examination has been scheduled. The insurer is required to provide a description of remedial actions taken or proposed to correct unremediated material weaknesses, if the actions are not described in the accountant's communication.

The Model requires that the Commissioner be notified when unremediated material weaknesses in internal control over financial reporting were noted during the audit. Previous versions of the Model required such communication when any significant deficiencies in internal control over financial reporting were noted during the audit, whether remediated or not. This distinction is important because of the level of severity of the internal control deficiency that is applicable to each term. The terms "material weakness" and "significant deficiency" have the same meaning respectively as used in PCAOB or American Institute of Certified Public Accountants (AICPA) auditing literature - PCAOB Auditing Standard No. 5, An Audit of Internal Control over Financial Reporting That is Integrated With an Audit of Financial Statements or AICPA AU Section 325, Communicating Internal Control Matters Identified in an Audit (see Section 17E of this Guide for the definitions of material weakness and significant deficiency that are included in the auditing literature). However, the insurer is expected to maintain information about significant deficiencies that were communicated by its auditors and such information should be available for review during the financial condition examination.

Effective for audits as of December 31, 2021, and thereafter, the information required in Section 12 of the MAR required to be communicated by the accountant should be supplemented by providing both the name of the current lead audit partner and the year at which he or she began serving in that capacity. For the purpose of maintaining confidentiality, this information will not be included in the annual letter of qualifications, but instead shall be included in the internal control communication required in Section 11 of the MAR by the accountant as a footer or under the firm signature as follows:

The engagement partner, [name], has served in that capacity with respect to the Company since [year that current term started].

Consistent with the Drafting Note¹ to Section 11 of the MAR, the information provided on the engagement partner shall remain confidential.

¹ The insurer is expected to maintain information about significant deficiencies communicated by the independent certified public accountant. Such information should be made available to the examiner conducting a financial condition examination for review and kept in such a manner as to remain confidential.

The following is an example of the type of communication that an insurer should prepare to communicate the remedial actions taken or proposed to correct a material weakness in its internal control over financial reporting noted during an audit.

Communication of Internal Control Related Matter Noted in an Audit - Sample

Honorable Commissioner
State of Domicile Insurance Department
State of Domicile

Dear Honorable Commissioner:

During the audit completed for the year ended December 31, 20XX, for XYZ Holding Company Inc (“XYZ”), a material weakness was noted in XYZ’s internal control over financial reporting related to the calculation of insurance reserves. Due to the manner in which the data for homeowners policies are captured by the systems used in its Southeastern US regional office, changes in XYZ’s estimate of insurance reserves for certain policies are not reviewed by XYZ’s Actuarial Department prior to being recorded in the company’s accounting records.

A material weakness is a deficiency or a combination of deficiencies in internal control, such that there is a reasonable possibility that a material misstatement of the entity’s financial statements will not be prevented, or detected and corrected on a timely basis. In connection with the weakness noted above, XYZ’s management has taken remedial actions to change its procedures for coding policies issued in the states affected so that all homeowners’ policy data are included in the Actuarial Department review of estimate of insurance reserves. This change was effective on July 1, 20XX.

Should you have any questions regarding this matter, please do not hesitate to contact me at the number noted above.

Regards,

XYZ Holding Company, Inc.

Requirements for Audit Committees (Section 14)

A disclaimer within Section 14 of the Model indicates that the section shall not apply to SOX Compliant Entities or wholly-owned subsidiaries of SOX Compliant Entities. This disclaimer was placed within the Model to avoid conflicts between the independence requirements of the Model and those required of public companies under Section 301 of the Sarbanes Oxley Act of 2002. The expectation of regulators in developing this disclaimer was that the same independent Audit committee required of public companies under Section 301 would be deemed to be the insurer’s Audit committee for purposes of this regulation (pursuant to Section 4D of the Model) or would participate in the oversight of the insurers within the group. Therefore, if material weaknesses, significant deficiencies and/or significant solvency concerns are identified at the legal entity level, the independent Audit committee should be involved in addressing these issues, regardless of their materiality at the consolidated, parent company level.

Independence of an Audit Committee Member (Section 14C)

A policyholder would be considered "independent" unless they receive direct compensation from the insurer for other unrelated services.

A person who is otherwise considered independent and also serves on the Board of Directors of a contracting entity (e.g., medical provider, vendors, banks, etc.) is considered independent.

An otherwise non-independent member of the Board of Directors is considered independent for Audit committee purposes if state law requires participation on the Board (e.g., Medical providers) as long as the member is not an officer or employee of the insurer or one of its affiliates.

Notification letter (Section 14E)

In accordance with Section 14E, upon the initial election by the insurer to designate the Audit committee of an entity that controls the insurer as its Audit committee, the insurer shall provide written notification to the Commissioner of the affected insurer. This notification shall identify the controlling entity and the basis for the election. This election remains in effect for perpetuity, until rescinded, at which time written notification would need to be provided to the Commissioner of the insurer. The notification letter should be timely filed with the Commissioner by the ultimate controlling person prior to the issuance of the statutory Audited financial report. However, each of the affected insurers (i.e. those that will have an Audit committee designated by its ultimate controlling person) that is subject to the provisions of Section 14 shall ensure that the notification letter is filed with the Commissioner. Absence such filing, each of the affected insurers would be individually responsible for complying with Section 14. For example, referring to the “Group of insurers” chart in Section 3, if the ABC Company is the ultimate controlling person and elects to have its Audit committee serve as the Audit committee for insurance company 5, then ABC Company would file the notification letter (insurance company 5 would have to ensure that the notification letter is filed or comply with Section 14 as a single entity). Once submitted, the election remains in effect until rescinded. The following example illustrates the reporting requirement.

The XYZ insurance company (e.g., insurance company 5) is an indirect subsidiary of and controlled by ABC Company. ABC Company has an independent Audit committee comprised of directors of ABC Company. XYZ insurance Company has elected to designate the Audit committee of ABC Company as the Audit committee of XYZ insurance Company for purposes of complying with Audit committee requirements of the Annual Financial Reporting Model Regulation.

Transitional Guidance (Section 14G)

Once a company exceeds the requisite thresholds for Audit committee requirements contained in Section 14 of the Model, it is required to comply with the Audit committee requirements by January 1 following one (1) complete calendar year. The following are examples of transitional period requirements.

A: Company surpasses \$300 million threshold:

ABC Insurance Company has reached the \$300 million requisite threshold in its December 31, 2011 audited statutory statement and therefore will be required to meet “majority (50% or more) member independence” Audit committee requirements by January 1, 2013, providing the company necessary time for recruitment and approvals.

B: Company surpasses \$500 million threshold:

ABC Insurance Company has subsequently reached the \$500 million requisite threshold in its December 31, 2014 audited statutory statement and therefore will be required to meet the “Supermajority (75% or more) member independence” Audit committee requirements by January 1, 2016.

C: Company drops below threshold amount:

If ABC Insurance Company has penetrated the requisite \$500 million threshold and has been in compliance with the requirements but subsequently drops below the \$500 million threshold, e.g., \$450 million in its December 31, 2018 audited statutory statements, the company would be subject to the “majority (50% or more) member independence” requirement and could reduce the Audit committee independence in 2019. Companies, however, are encouraged to structure their Audit committees with at least a supermajority of independent Audit committee members.

Hardship Waiver (Section 14H)

An insurer may make application to the Commissioner for a waiver from the Section 14 requirements based upon hardship. Examples may include, but are not limited to, requests based on the business type of the entity, the availability of qualified board members, or the ownership (e.g., entities owned by non-profit health systems) or organizational structure of the entity. If the application for a waiver is approved, the insurer would file, with its annual statement filing, the approval for relief from Section 14 with the states that it is licensed in or doing business in and the NAIC. If the nondomestic state accepts electronic filing with the NAIC, the insurer would file the approval in an electronic format acceptable to the NAIC.

Management’s Report of Internal Control over Financial Reporting (Section 17)

Premium Threshold (Section 17A)

The term “direct written premium” is frequently associated with the property/casualty business. While the Model continues to use the term, it raises the question for other businesses, e.g., life and fraternal, what is the appropriate measure for assessing compliance? The following examples have been developed to illustrate the computation since the starting point is the audited financial statements of the reporting entity, and it is possible that the amount reported may not be consistent with written premium as reported in the regulatory reporting blank.

The annual direct written and assumed premium:

- ◆ will be derived from the annual Audited financial report of an individual insurer, as of December 31 immediately preceding
- ◆ are generally reported in the Statement of Operations of the Audited Financial Report on an ‘earned’ and a ‘net of reinsurance ceded’ basis
- ◆ will be computed by making the following adjustments:

P/C, Health and Title entities:

	\$
Premiums earned (Statement of Income in Audited financial report)	A
Add/Deduct: Change in unearned premium	B
Add: Reinsurance ceded	C
Direct written and assumed premium *	D=A+B+C

*Note: Direct written and assumed premium would be reduced by any premiums reinsured with the Federal Crop Insurance Corporation and Federal Flood Program

- A - Premiums earned per the Statement of Income will generally equal the Annual Statement, Page 4.
- B - Change in unearned premium is the difference between the current period amount and the prior year-end amount reported in the liabilities section of the balance sheet. The amount may also be derived from other company prepared exhibits.
- C - Reinsurance ceded may be derived from the notes to the Audited financial report, if disclosed, or other company prepared exhibits or schedules. If the Statement of Income or Statement of Operations separately presents reinsurance ceded, an adjustment is not required.
- D - Must be equal to, or greater than, \$500 million in order to be subject to Section 17 reporting.

Life and Fraternal entities:

	\$
Premiums earned (Statement of Operations in Audited financial report)	A
Add: Reinsurance ceded	B
Direct written and assumed premium	C=A+B

- A - Premiums earned per the Statement of Operations will generally equal the Annual Statement, Page 4.
- B - Reinsurance ceded may be derived from the notes to the Audited financial report, if disclosed, or other company prepared exhibits or schedules. If the Statement of Operations separately presents reinsurance ceded, an adjustment is not required.
- C - Must be equal to, or greater than, \$500 million in order to be subject to Section 17 reporting.

Companies in an RBC Level Event or in Hazardous Financial Condition (Section 17B)

For purposes of this subsection, the phrase “RBC level event” refers to any of the regulatory action levels described in the Risk-Based Capital requirements or the trend test. For example, if the reporting entity’s total adjusted capital is equal to or less than 200% of the required risk-based capital, the result would trigger regulatory action.

Management’s Report of Internal Control over Financial Reporting (Sections 17C & 17D)

Management must annually provide their domiciliary insurance department with a report on internal controls over the statutory financial statement process. Recognizing it may not always be practical, insurers are encouraged to file the report concurrently with the filing of the annual Audited financial report for those years in which the insurer is aware that a financial condition examination has been scheduled. The elements to be included in the report are outlined in 17D.

As outlined in Section 17C, an addendum is required for all reports that rely on a Section 404 Report (Sarbanes-Oxley). The Model states that the Section 404 Report means management’s report on internal control over financial reporting as defined by the SEC and the related attestation report of the independent certified public accountant. However, in 2010, the Dodd-Frank Act exempted non-accelerated SEC filers (those reporting companies that do not meet the definition of either an “accelerated filer” or a “large accelerated filer” under Exchange Act Rule 12b-2.) from the requirement to obtain the related attestation report of the independent certified public accountant. As such, non-accelerated SEC filers may file a Section 404 Report that does not include an attestation report of the independent certified public accountant, along with the appropriate addendum, to fulfill requirements in this area.

Alternately, insurers may utilize a report received as a result of work performed in accordance with Statement of Standards in Attestation Engagements (SSAE) No. 15 in a similar fashion to a Section 404 Report. As such, there are two main types of reports that can be provided:

- Reports from entities that have complied with all required elements of Section 404 of the Sarbanes-Oxley Act (or have received an SSAE No. 15 report) either as a requirement or on a voluntary basis.
- Reports from entities that have not complied with Section 404 of the Sarbanes-Oxley Act (or have not received an SSAE No. 15 report).

Appendix 1 of this guide provides examples of Management's Report of Internal Controls over Financial Reporting utilizing various facts and circumstances.

Section 17D(2): Management must make an assertion regarding the effectiveness of the insurer's Internal control over financial reporting to the best of its knowledge and belief after diligent inquiry. For purposes of filing the report, "diligent inquiry" means conducting a search and thorough review of relevant documents which are reasonably likely to contain significant information with regards to Internal control over financial reporting and making reasonable inquiries of current employees and agents whose duties include responsibility for Internal control over financial reporting.

Section 17D(5): The report must disclose any unremediated material weaknesses in Internal control over financial reporting that exist as of the balance sheet date. If the insurer or Group of insurers has identified an unremediated material weakness, management is not permitted to conclude that its Internal control over financial reporting is effective and it must include a description of the nature of any unremediated material weakness in the report. December 31 is used as the measurement date to whether a material control weakness is unremediated for purposes of reporting under this section of the Model.

Section 17D(6): Users of the report should be aware of the inherent limitations in Internal control over financial reporting. PCAOB Auditing Standard No. 5, An Audit of Internal Control over Financial Reporting That is Integrated With an Audit of Financial Statements provides the following description of such inherent limitations:

Internal control over financial reporting has inherent limitations. Internal control over financial reporting is a process that involves human diligence and compliance and is subject to lapses in judgment and breakdowns resulting from human failures. Internal control over financial reporting also can be circumvented by collusion or improper management override. Because of such limitations, there is a risk that material misstatements will not be prevented or detected on a timely basis by internal control over financial reporting. However, these inherent limitations are known features of the financial reporting process. Therefore, it is possible to design into the process safeguards to reduce, though not eliminate, this risk.

Additionally, readers of the report should be aware that projecting management's assertion regarding the effectiveness of Internal control over financial reporting to future periods is subject to the risk that controls may become inadequate because of changes in conditions, or the degree of compliance with policies or procedures may deteriorate.

Section 17D(7): The report must include signatures of the chief executive officer and chief financial officer (or the equivalent position/title). If a report is being filed on behalf of a Group of insurers, management should identify the officeholders (i.e., the CEO and CFO of Company ABC) that have the authority to sign the report on behalf of the all of the legal entities being reported upon within the Group of insurers.

Basis for Management's Review and Assertions (Section 17E)

One of the primary reasons for the new Section 17 of the Model is to bring additional focus and attention to internal control over financial reporting. Financial reporting is the underpinning of many of the solvency oversight activities of insurance regulators. Section 17 of the Model identifies management's responsibilities for internal control over financial reporting and provides regulators additional assurances of the effectiveness of internal control practices in a cost effective manner.

The basis for Management's Report of Internal Control over Financial Reporting shall be subject to insurance departments' financial condition examinations. Because of this and other solvency tools available to regulators, there is no requirement that the independent certified public accountant be engaged to perform an examination of the effectiveness of internal control over financial reporting. However, Section 9 requires the independent public accountant to consider (as that term is defined in AICPA Statement on Auditing Standards (SAS) No. 102, Defining Professional Requirements in Statements on Auditing Standards, or its replacement) the most recently available Management's Report of Internal Control over Financial Reporting in planning and performing the audit of the statutory financial statements. SAS No. 102, paragraph 4 states, "If a SAS provides that a procedure or action is one that the auditor "should consider," the consideration of the procedure or action is presumptively required, whereas carrying out the procedure or action is not." AU Section 319 of the Professional Standards of the AICPA, Consideration of Internal Control in a Financial Statement Audit, requires that the auditor obtain an understanding of internal control sufficient to plan and execute the audit. It is in this context that the auditor is required to "consider" management's report. There is no requirement that the auditor test or otherwise use management's report.

The Model does not mandate a specific framework for management's review and evaluation of internal controls. SEC registrants typically (but are not required to) use the COSO Internal Control-Integrated Framework in assessing the effectiveness of internal control over financial reporting. The COSO-sponsored "Enterprise Risk Management-Integrated Framework" and the PCAOB Guidance for Smaller Public Companies Reporting on Internal Control over Financial Reporting are other examples of relevant literature companies may want to consider in applying such a framework. Under the Model, however, management, when making its assessment and preparing its report, has discretion as to the nature of the internal control framework used. Insurers shall have flexibility as to the frequency and scope of testing activities and the documentation provided upon examination to support the assertions. Management should assess and select an appropriate framework or approach based upon its business risks and objectives.

Management's assertions about the effectiveness of internal controls enhance oversight and understanding of insurer solvency by allowing regulators to have greater confidence in the accuracy of financial reporting, which also provides a benefit to policyholders and creditors. An expected benefit of this enhancement, where internal controls are effective, is that financial examinations will become more efficient and risk-focused.

Management's Report of Internal Control over Financial Reporting may span more than one legal entity. Because internal controls are primarily about processes and these processes are often applied across multiple legal entities within an organization, (e.g., investment systems, premium and loss/benefit systems, and financial reporting processes), management may consider common processes and the associated controls when determining the Group of insurers for reporting purposes.

The Model provides flexibility in meeting the requirements of Section 17D and E. The controls included in the scope of management's report should only include those controls deemed significant or critical by management. The following examples represent aspects and components of internal control that insurers may want to consider when making the assertions and determining relevant documentary evidence. These are not intended to serve as, and should not be considered, requirements:

- The internal control environment including oversight provided by the Audit committee of the Board of Directors. Insurers may want to consider how they can demonstrate “Tone at the Top.” The insurer’s compliance programs, code of conduct and the processes for reporting policy exceptions and overrides of controls may also be appropriate to consider.
- The risk assessment process utilized and identification of the areas of potential material internal control risk related to the financial statement. Risk areas that one might typically find for an insurance enterprise include:
 - Investments (including capital expenditures)
 - Policy and Claim Reserves
 - Benefit Payments
 - Premiums / Agent’s Balances
 - Reinsurance
 - Related Party (Affiliate) Transactions
 - Operating Expenses/Taxes
- The control activities in place including procedures over financial reporting, which in management’s judgment are appropriate under the circumstances. These might include the daily or monthly controls management relies upon in the normal course of its activities. They would also include any SAS 70 reports received from vendors upon which management relies. General information systems and technology controls might also be considered.
- The monitoring and testing processes used in the normal course of business to ascertain that the internal controls are in place and are working as intended. Insurers may want to consider describing the purpose, function or role of an internal audit department and/or describe other self-audit and analysis activities.
- The information and communication processes, including the frequency of reporting and monitoring activities and communication of internal control responsibilities.

Section 17D(5) of the Model indicates that if one or more unremediated material weaknesses in Internal control over financial reporting exists as of the balance sheet date, then management is not permitted to conclude that internal control over financial reporting is effective and it must include a description of the nature of any unremediated material weaknesses in the report. For purposes of this determination, material weakness has the same meaning as used in PCAOB or AICPA auditing literature – PCAOB Auditing Standard No. 5, An Audit of Internal Control over Financial Reporting That is Integrated With an Audit of Financial Statements or AICPA AU Section 325, Communicating Internal Control Related Matters Identified in an Audit. Such guidance provides the following definitions:

Significant Deficiency – A significant deficiency is a deficiency, or a combination of deficiencies, in internal control that is less severe than a material weakness, yet important enough to merit attention by those charged with governance.

Material Weakness – A material weakness is a deficiency, or combination of deficiencies, in internal control, such that there is a reasonable possibility that a material misstatement of the entity’s financial statements will not be prevented, or detected and corrected on a timely basis.

Insurers filing Management’s Report of Internal Control over Financial Reporting as a Group of insurers may want to also consider identifying or documenting common systems and controls used by multiple companies within an insurance holding company system and how such information was used in the development of the Group of insurers for reporting purposes.

To allow insurers to comply with Section 17 in a cost effective manner, management may base its assertions, in part, upon its review, monitoring and testing processes performed in the normal course of its activities. Management may also consider diligent inquiry of key process owners throughout the organization to provide additional assurance as to the operating effectiveness of its internal control over financial reporting. For purposes of filing the report, “diligent inquiry” means conducting a search and thorough review of relevant documents which are reasonably likely to contain significant information with regards to Internal control over financial reporting and making reasonable inquiries of current employees and agents whose duties include responsibility for Internal control over financial reporting.

Exemptions and Effective Dates (Section 18)

Hardship Waivers (Section 18A)

Notwithstanding any other provision of the Model, an insurer may make written application to the Commissioner for waiver from any or all provisions of the Model based upon financial or organizational hardship. For example, the Commissioner could under this section grant a waiver of the Section 14B audit committee independence requirements to a company exceeding the \$500 million premium threshold, even though the Section 14H waiver would not apply. This exemption is granted at the discretion of the Commissioner, and may be granted at any time for a specified period or periods.

Specific Effective Dates (Section 18F)

An insurer will be required to file a Section 17 report if the insurer exceeds the premium threshold (as defined in Section 17A.)

1. Assume the insurer reports premiums as follows (note that the direct written and assumed premium in these examples would be reduced by any premiums reinsured with the Federal Crop Insurance Corporation and Federal Flood Program) :

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Net (written) premiums, per Statement of Operations in Audited financial report	350.3	390.8	410.5	425.7	450.8
Add: Reinsurance ceded	100.5	115.7	115.8	120.1	127.2
Gross direct written and assumed premium	450.8	506.5	526.3	545.8	578.0

In the above example, the insurer has reached the requisite threshold in 201x+1 and therefore will file its first Section 17 report effective December 31, 201x+3.

2. Assume the insurer reports premiums as follows:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Net (written) premiums, per Statement of Operations in Audited financial report	350.3	380.5	390.8	410.5	425.7
Add: Reinsurance ceded	100.5	110.7	115.7	115.8	120.1
Gross direct written and assumed premium	450.8	491.2	506.5	526.3	545.8

In the above example, the insurer has reached the requisite threshold in 201x+2 and therefore will file its first Section 17 report effective December 31, 201x+4.

3. Assume the insurer reports premiums as follows:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Net (written) premiums, per Statement of Operations in Audited financial report	350.3	390.8	380.5	410.5	425.7
Add: Reinsurance ceded	100.5	115.7	110.7	115.8	120.1
Gross direct written and assumed premium	450.8	506.5	491.2	526.3	545.8

In the above example, the insurer has reached the requisite threshold in 201x+1 and therefore will file its first Section 17 report effective December 31, 201x+3. Because the insurer dropped below the threshold in 201x+2, the insurer is not required to file a Section 17 report and thus, the reporting period starts over. The insurer reaches the threshold in 201x+3 and therefore, required to file the Section 17 report effective December 31, 201x+5. The insurer may choose to begin voluntarily filing the Section 17 report beginning with 201x+3 especially if the insurer has done the work to prepare the report.

Business Combination

A business combination is defined as acquisition of insurance/reinsurance business through:

- A. a stock acquisition,
- B. inforce reinsurance assumption, or
- C. a merger of insurers in a Group of insurers

A. Stock Acquisitions

Assume Company A, which has premiums of \$500m or more, buys Company B and retains Company B as a separate legal entity.

If Company B has premiums of less than \$500m (as derived from Section 17A), no Section 17 report is required.

If Company B has premiums of \$500m or more (as derived from Section 17A), a Section 17 report is required.

1. Assume Company B is acquired effective January 1, 201x and subsequently reports premiums as follows. Assume further that Company A and B elect to file separate Section 17 reports:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Net (written) premiums, per Statement of Operations in Audited financial report	350.3	390.8	410.5	425.7	450.8
Add: Reinsurance ceded	100.5	115.7	115.8	120.1	127.2
Gross direct written and assumed premium	450.8	506.5	526.3	545.8	578.0

In the above example, Company B has reached the requisite threshold in 201x+1 and therefore will file its first Section 17 report effective December 31, 201x+3.

2. Assume Company B is acquired June 30, 201x+2 by Company A and Company B has premiums as follows. Assume further that Company A elects to file a single Section 17 report with the Group of insurers consisting of Company A and B:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Net (written) premiums, per Statement of Operations in Audited financial report	350.3	390.8	410.5	425.7	450.8
Add: Reinsurance ceded	100.5	115.7	115.8	120.1	127.2
Gross direct written and assumed premium	450.8	506.5	526.3	545.8	578.0

In the above example, Company B has reached the requisite threshold in 201x+1 and therefore will file its first Section 17 report effective December 31, 201x+3. However due to the acquisition in 201x+2, the first combined Section 17 report, i.e., Group of insurers, would be effective December 31, 201x+4, two years subsequent to acquisition.

B. Inforce Reinsurance Assumption

For the purposes of determining premiums pursuant to Section 17A, assumed premiums from the assumption of an inforce reinsurance transaction will be excluded from the measurement of premiums, for two calendar years subsequent to acquisition.

Assume the insurer assumed an inforce transaction effective June 30, 201x+2 and reports premiums as follows:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Net (written) premiums, per Statement of Operations in Audited financial report	350.3	390.8	610.5	850.7	875.8
Add: Reinsurance ceded	100.5	115.7	115.8	120.1	127.2
Gross direct written and assumed premium	450.8	506.5	726.3	970.8	1,003.0
Less: Gross assumed premium resulting from a business combination	0	0	200.0	425.0	425.0
Gross direct written and assumed premium, subject to Section 17	450.8	506.5	526.3	545.8	578.0

In the above example, the insurer has reached the requisite threshold in 201x+1 and therefore will file its first Section 17 report effective December 31, 201x+3, however only for business inforce in 201x+1 and still inforce in 201x+3. The business assumed at June 30, 201x+2 will be subject to a Section 17 report effective December 31, 201x+4, two calendar years after acquisition.

C. Mergers of Insurers in a Group of Insurers

If the merged insurer has premiums of less than \$500m (as derived from Section 17A), a Section 17 report is not required.

If the merged insurer has premiums of \$500m or more (as derived from Section 17A), a Section 17 report is required.

1. Assume that Insurer A and Insurer B have Gross direct written and assumed premiums as follows, and agree to merge effective January 1, 201x+1, with Insurer A as the surviving entity:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Gross direct written and assumed premium – Insurer A	450.3	460.8	510.5	n/a	n/a
Gross direct written and assumed premium – Insurer B	100.5	115.7	115.8	n/a	n/a
Less: Intercompany transactions – gross	-	65.3	62.2	n/a	n/a
Combined gross direct written and assumed premiums Insurer A	-	511.2	564.1	n/a	n/a

In the above example, the merged entity (insurer A) has reached the requisite threshold in 201x+1, and will file its first Section 17 report effective December 31, 201x+3.

2. Assume that Insurer A and Insurer B have Gross direct written and assumed premiums as follows, and agree to merge effective January 1, 201x+2, with Insurer A as the surviving entity:

\$ millions	201x	201x+1	201x+2	201x+3	201x+4
Gross direct written and assumed premium – Insurer A	450.3	460.8	510.5	n/a	n/a
Gross direct written and assumed premium – Insurer B	100.5	115.7	115.8	n/a	n/a
Less: Intercompany transactions – gross	-	-	62.2	n/a	n/a
Combined gross direct written and assumed premiums Insurer A	-	-	564.1	n/a	n/a

In the above example, the merged entity (insurer A) has reached the requisite threshold in 201x+2, and will file its first Section 17 report effective December 31, 201x+4, two years subsequent to merger.

APPENDIX 1

Illustrative Examples of Management’s Report of Internal Control over Financial Reporting

The following are examples of Management’s Report of Internal Controls over Financial Reporting utilizing different facts and circumstances. These are only examples and individual company facts and circumstances will dictate the contents of their report. However, there are common elements that should be included in all reports as discussed in Sections 17C and 17D of the Model.

Example A: An SEC registrant or a member of a holding company system whose parent is an SEC registrant that had all material control processes over statutory financial reporting addressed in its Section 404 report Page 23

Example B: An SEC registrant or a member of a holding company system who is a SEC registrant and is a non-accelerated filer that had all material control processes over statutory financial reporting addressed in its Section 404 report. For these non-accelerated filers, the Section 404 report does not require the report of independent registered public accounting firm on internal control over financial reporting..... Page 25

Example C: An SEC registrant or a member of a holding company system whose parent is an SEC registrant that did not have all material control processes over statutory financial reporting addressed in its Section 404 report..... Page 27

Example D: An SEC registrant or a member of a holding company system who is a SEC registrant and is a non-accelerated filer that did not have all material control processes over statutory financial reporting addressed in its Section 404 report. For these non-accelerated filers, the Section 404 report does not require the report of independent registered public accounting firm on internal control over financial reporting..... Page 30

Example E: A non-SEC registrant or a member of a holding company system that voluntarily complied with Section 404 of the Sarbanes-Oxley Act and produced a report on internal controls which included an auditor’s opinion..... Page 33

Example F: A company [or “group of insurers”] that is not subject to Section 404 and utilized their own framework to evaluate controls..... Page 35

Example G: An SEC registrant or a member of a holding company system whose parent is an SEC registrant that had all material control processes addressed in their Section 404 report and had an unremediated material weakness..... Page 37

Example H: An SEC registrant or member of a holding company system whose parent is an SEC registrant that did not include all material processes over statutory financial reporting addressed in its Section 404 report and had an unremediated material weakness noted Page 39

Example I: An SEC registrant or member of a holding company system whose parent is an SEC registrant that had all material processes over statutory financial reporting addressed in its Section 404 report. However, they recently acquired another insurer that is not included in their assessment Page 42

EXAMPLE A: AN SEC REGISTRANT OR A MEMBER OF A HOLDING COMPANY SYSTEM WHOSE PARENT IS AN SEC REGISTRANT THAT HAD ALL MATERIAL CONTROL PROCESSES OVER STATUTORY FINANCIAL REPORTING ADDRESSED IN ITS SECTION 404 REPORT

Management’s Report of Internal Control over Financial Reporting

XYZ Holding Company Inc (“XYZ”) is required to file annual reports on Form 10-K/20-F with the U.S. Securities and Exchange Commission. Each of the insurance companies listed on Attachment B is a wholly owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model], as the insurance companies listed on Attachment B.

Management of XYZ is responsible for establishing and maintaining adequate internal control over statutory financial reporting. XYZ’s internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements in accordance with statutory accounting principles. Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Group of insurers’ internal control over statutory financial reporting, based on the framework established in *Internal Control—Integrated Framework Issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO)*. Based on our assessment under that framework, management concluded that the Group of insurers’ internal control over statutory financial reporting is effective to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements as of December 31, 201X.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In satisfaction of the Group of insurers’ obligation to deliver Management’s Report of Internal Control over Financial Reporting for the fiscal year ended December 31, 201X, as permitted by [relevant state statute or Section 17C of the Model], XYZ is hereby providing the Insurance Commissioner of [domiciliary state] copies of Management’s Report of Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting for XYZ included in XYZ’s Form 10-K/20-F for the fiscal year ended December 31, 201X (or alternatively the Annual Report to Stockholders). In addition, an Addendum (Attachment A) is included to this report which identifies the material processes that were not included in the Section 404 Report (as defined in Attachment A).

Based on management review of internal controls, there were no unremediated material weaknesses as of December 31, 201X identified as part of the Group of insurers’ internal control structure over the statutory financial statements for the year ended December 31, 201X.

ATTACHMENT A**XYZ Holding Company, Inc.****Addendum to Management’s Report of Internal Control over Financial Reporting
For the Year Ended December 31, 201X**

For purposes of this addendum, the “Section 404 Report” means Management’s Report on Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting contained in or incorporated by reference in the Form 10-K/20-F. Accordingly, as required by [relevant state statute or Section 17C of the Model], management of XYZ hereby affirms that there are no material processes with respect to the preparation of the audited statutory financial statements of the Group of insurers that were excluded from the Section 404 Report.

ATTACHMENT B**XYZ Holding Company, Inc.****Management’s Report of Internal Control over Financial Reporting

DEF Insurance Subsidiary	12346
GHI Insurance Subsidiary	12347
JKL Insurance Subsidiary	12348
MNO Insurance Subsidiary	12349

Not for Distribution

EXAMPLE B: AN SEC REGISTRANT OR A MEMBER OF A HOLDING COMPANY SYSTEM WHO IS A SEC REGISTRANT AND IS A NON-ACCELERATED FILER THAT HAD ALL MATERIAL CONTROL PROCESSES OVER STATUTORY REPORTING ADDRESSED IN ITS SECTION 404 REPORT. FOR THIS NON-ACCELERATED FILER, THE SECTION 404 REPORT DOES NOT REQUIRE THE REPORT OF INDEPENDENT REGISTERED PUBLIC ACCOUNTING FIRM ON INTERNAL CONTROL OVER FINANCIAL REPORTING.

Management’s Report of Internal Control over Financial Reporting

XYZ Holding Company, Inc. (“XYZ”) is required to file annual reports on Form 10-K/20-F with the U.S. Securities and Exchange Commission. Each of the insurance companies listed on Attachment B is a wholly owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model] as the insurance companies listed on Attachment B.

Management of XYZ is responsible for establishing and maintaining adequate internal control over statutory financial reporting. XYZ’s internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements in accordance with statutory accounting principles. Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Group of insurers’ internal control over statutory financial reporting, based on the framework established in Internal Control—Integrated Framework Issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). Based on our assessment under that framework, management concluded that the Group of insurers’ internal control over statutory financial reporting is effective to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements as of December 31, 201X.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In satisfaction of the Group of insurers’ obligation to deliver Management’s Report of Internal Control over Financial Reporting for the fiscal year ended December 31, 201X, as permitted by [relevant state statute or Section 17 of the Model], XYZ is hereby providing the Insurance Commissioner of [domiciliary state] copies of Management’s Report of Internal Control over Financial Reporting included in XYZ’s Form 10-K/20-F for the fiscal year ended December 31, 201X (or alternatively the Annual Report to Stockholders). This does not include a report of independent registered public accounting firm on internal control over financial reporting for XYZ, as it is not required for non-accelerated filers. In addition, an Addendum (Attachment A) is included to this report which identifies the material processes that were not included in the Section 404 Report (as defined in Attachment A).

Based on management review of internal controls, there were no unremediated material weaknesses as of December 31, 201X identified as part of the Group of insurers’ internal control structure over the statutory financial statements for the year ended December 31, 201X.

ATTACHMENT A**XYZ Holding Company, Inc.
Addendum to Management's Report of Internal Control over Financial Reporting
For the Year Ended December 31, 201X**

For purposes of this filing, the "Section 404 Report" means Management's Report of Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting contained in or incorporated by reference in the Company's Form 10-K/20-F. Accordingly, as required by [relevant state statute or Section 17C of the Model], management of XYZ hereby affirms that the only material processes with respect to the preparation of the audited statutory financial statements of the Group of insurers that were excluded from the Section 404 Report are the processes discussed below. Management of XYZ hereby affirms that all other material processes with respect to the preparation of the audited statutory financial statements of the Group of insurers were included in the Section 404 Report. The following statutory financial reporting processes were reviewed separately from the internal controls reported by the Group of insurers in its Section 404 report:

Significant Control Processes not tested due to Group Materiality Considerations

The Section 404 report excludes certain control processes deemed material to individual insurance legal entities included within the Group of insurers. This exclusion was due to group materiality decisions made at the parent company level. These processes, and the legal entities within the Group of insurers impacted, are listed as follows:

Workers' Compensation Claims Processing – The HIJ claims processing system is utilized to process workers' compensation claims material to ABC Insurance Subsidiary and DEF Insurance Subsidiary.

Related Party Transactions Eliminated through Consolidation

The Section 404 report does not consider controls surrounding related party transactions as the effects of those transactions are eliminated through consolidation at the holding company financial statement level. Significant related party transactions, and the legal entities within the Group of insurers impacted, are listed as follows:

Affiliate reinsurance agreements – A significant amount of reinsurance coverage is obtained by ABC Insurance Subsidiary and DEF Insurance Subsidiary through contracts with XYZ Parent Company.

Management service agreements – ABC Insurance Subsidiary receives all of its management services through an agreement with XYZ Parent Company.

Tax allocation agreements – ABC Insurance Subsidiary and DEF Insurance Subsidiary are subject to an intercompany tax allocation agreement with XYZ Parent Company.

Deferred Income Taxes

Federal income taxes are provided for XYZ's estimated current and deferred liability. Deferred taxes are provided for differences between the financial statement and tax bases of assets and liabilities. Pursuant to *SSAP No. 101—Income Taxes*, changes in deferred tax assets and liabilities are recognized as a separate component of gains and losses in statutory surplus, while under GAAP/IFRS, these changes are included in income tax expense or benefit. Gross deferred tax assets not meeting the realization criteria outlined in *SSAP No. 101* are not admitted.

Nonadmitted Assets

Certain XYZ assets (principally furniture, equipment, prepaid expenses, agents' balances, and certain deferred tax assets) have been designated as nonadmitted assets under statutory accounting guidance (primarily in *SSAP No. 4—Assets and Nonadmitted Assets* and *SSAP No. 20—Nonadmitted Assets*). Such nonadmitted assets are excluded from assets by a charge to statutory surplus. Under GAAP/IFRS, such amounts are carried at amortized cost with an appropriate valuation allowance, as necessary.

Asset Valuation Reserve (“AVR”)

The AVR represents a statutory contingency reserve for life and health insurers for credit related risk on most invested assets, and is charged to surplus pursuant to *SSAP No. 7—Asset Valuation Reserve and Interest Maintenance Reserve*. No such reserve is required under GAAP/IFRS accounting.

Interest Maintenance Reserve (“IMR”)

The IMR represents the deferral of interest-related realized gains and losses, net of tax, on primarily fixed maturity investments, amortized into income over the remaining life of the investment sold pursuant to *SSAP No. 7—Asset Valuation Reserve and Interest Maintenance Reserve*. No such reserve is required under GAAP/IFRS accounting.

Management of XYZ conducted an assessment of the internal controls over these processes and concluded that they were effective with respect to the audited statutory financial statements.

(Please note that this is not intended to be an all-inclusive list. It should only include material process that were not covered in the Section 404 Report. The facts and circumstances of each situation will determine the items to be included.)

Management’s Report of Internal Control over Financial Reporting

As a non-SEC registrant, XYZ Holding Company, Inc. (“XYZ”) is not required to prepare or file with the U.S. Securities and Exchange Commission a Sarbanes-Oxley Act Section 404 report on internal control over financial reporting. However, management has elected to prepare, and have audited by XYZ’s independent certified public accountant, such a report for the fiscal year-ended December 31, 201X.

Each of the insurance companies listed on Attachment B is a wholly owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model], as the insurance companies listed on Attachment B.

Management of XYZ is responsible for establishing and maintaining adequate internal control over statutory financial reporting. XYZ’s internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements in accordance with statutory accounting principles. Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Group of insurers’ internal control over statutory financial reporting, based on the framework established in *Internal Control—Integrated Framework Issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO)*. Based on our assessment under that framework, management concluded that the Group of insurers’ internal control over statutory financial reporting is effective to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements as of December 31, 201X.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In satisfaction of the Group of insurers’ obligation to deliver Management’s Report of Internal Control over Financial Reporting for the fiscal year ended December 31, 201X, as permitted by [relevant state statute or Section 17C of the Model], XYZ is hereby providing the Insurance Commissioner of [domiciliary state] the attached copy of XYZ’s Section 404 Report for the fiscal year ended December 31, 201X, which includes Management’s Report of Internal Control over Financial Reporting and report of independent registered public accounting firm on internal control over financial reporting for XYZ. In addition, an Addendum (Attachment A) is included to this report that identifies the material processes that were not included in the Section 404 Report (as defined in Attachment A).

Based on management review of internal controls, there were no unremediated material weaknesses as of December 31, 201X identified as part of the Group of insurers’ internal control structure over the statutory financial statements for the year ended December 31, 201X.

EXAMPLE F: A COMPANY [OR “GROUP OF INSURERS”] THAT IS NOT SUBJECT TO SECTION 404 AND UTILIZED THEIR OWN FRAMEWORK TO EVALUATE CONTROLS

Management’s Report of Internal Control over Financial Reporting

[As a non-SEC registrant, XYZ Holding Company, Inc. (“XYZ”) is not required to prepare or file with the U.S. Securities and Exchange Commission a Sarbanes-Oxley Act Section 404 report on internal control over financial reporting. Each of the insurance companies listed on Attachment A is a wholly owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model], as the insurance companies listed on Attachment A.]

Management of ABC Insurance Company [or XYZ] is responsible for establishing and maintaining adequate internal control over statutory financial reporting. The Company has established an internal control system designed to provide reasonable assurance regarding the fair presentation of statutory financial reporting. The Company developed its own internal framework for evaluating the effectiveness of internal control over statutory financial reporting. The Company’s framework includes the identification and evaluation of the company’s internal control environment and areas of potential material internal control risk, documentation of existing internal controls, monitoring and testing of those key controls, documentation of remedial actions planned or taken, if any, and communication of the findings of the evaluation by the Company’s senior management to the Audit committee of the Board of Directors.

Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Company’s internal control over statutory financial reporting, which included identifying, reviewing, monitoring and testing significant internal controls over statutory financial reporting. Based on our assessment under the above described approach and through diligent inquiry, management has concluded that the Company’s internal control over statutory financial reporting is effective to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements as of December 31, 201X.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Based on management review of internal controls, there were no unremediated material weaknesses as of December 31, 201X identified as part of the Company’s internal control structure over the statutory financial statements for the year ended December 31, 201X.

Not for Distribution

EXAMPLE G: AN SEC REGISTRANT OR A MEMBER OF A HOLDING COMPANY SYSTEM WHOSE PARENT IS AN SEC REGISTRANT THAT HAD ALL MATERIAL CONTROL PROCESSES ADDRESSED IN THEIR SECTION 404 REPORT AND HAD AN UNREMIEDIATED MATERIAL WEAKNESS

Management’s Report of Internal Control over Financial Reporting

XYZ Holding Company, Inc. (“XYZ”) is required to file annual reports on Form 10-K/20-F with the U.S. Securities and Exchange Commission. Each of the insurance companies listed on Attachment B is a wholly-owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model], as the insurance companies listed on Attachment B.

Management of XYZ is responsible for establishing and maintaining adequate internal control over statutory financial reporting. XYZ’s internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements in accordance with statutory accounting principles.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Group of insurers’ internal control over statutory financial reporting, based on the framework established in *Internal Control—Integrated Framework Issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO)*.

A material weakness was noted in XYZ’s internal control over financial reporting related to the calculation of insurance reserves. Due to the manner in which the data for homeowners policies are captured by the systems used in its Southeastern US regional office, changes in XYZ’s estimate of insurance reserves for certain policies are not reviewed by XYZ’s Actuarial Department prior to being recorded in the company’s accounting records.

A material weakness is a deficiency or a combination of deficiencies in internal control, such that there is a reasonable possibility that a material misstatement of the company’s financial statements will not be prevented, or detected and corrected on a timely basis. In connection with the weakness noted above, XYZ’s management has taken remedial actions to change its procedures for coding policies issued in the states affected so that all homeowners policy data are included in the Actuarial Department review of estimate of insurance reserves. This change was effective on July 1, 20XX.

As a result of the unremediated material weakness described above, XYZ management has concluded that, as of December 31, 201X, XYZ’s internal control over statutory financial reporting was not effective.

In satisfaction of the Group of insurers’ obligation to deliver Management’s Report of Internal Control over Financial Reporting for the fiscal year ended December 31, 201X, as permitted by [relevant state statute or Section 17C of the Model], XYZ is hereby providing the Insurance Commissioner of [domiciliary state] copies of Management’s Report of Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting for XYZ included in XYZ’s Form 10-K/20-F for the fiscal year ended December 31, 201X (or alternatively the Annual Report to Stockholders). In addition, an Addendum (Attachment A) is included to this report which identifies the material processes that were not included in the Section 404 Report (as defined in Attachment A).

XYZ Holding Company, Inc. (“XYZ”) is required to file annual reports on Form 10-K/20-F with the U.S. Securities and Exchange Commission. Each of the insurance companies listed on Attachment B is a wholly-owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model], as the insurance companies listed on Attachment B.

Management of XYZ is responsible for establishing and maintaining adequate internal control over statutory financial reporting. XYZ’s internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements in accordance with statutory accounting principles. Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Group of insurers’ internal control over statutory financial reporting, based on the framework established in *Internal Control—Integrated Framework Issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO)*.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

A material weakness was noted in XYZ’s internal control over financial reporting related to the calculation of insurance reserves. Due to the manner in which the data for homeowners policies are captured by the systems used in its Southeastern US regional office, changes in XYZ’s estimate of insurance reserves for certain policies are not reviewed by XYZ’s Actuarial Department prior to being recorded in the company’s accounting records.

A material weakness is a deficiency or a combination of deficiencies in internal control, such that there is a reasonable possibility that a material misstatement of the company’s financial statements will not be prevented, or detected and corrected on a timely basis. In connection with the assessment above, XYZ’s management identified a material weakness as of December 31, 201X in the controls over the calculation of insurance reserves.

As a result of the unremediated material weakness described above, XYZ management has concluded that, as of December 31, 201X, XYZ’s internal control over statutory financial reporting was not effective.

In satisfaction of the Group of insurers’ obligation to deliver Management’s Report of Internal Control over Financial Reporting for the fiscal year ended December 31, 201X, as permitted by [relevant state statute or Section 17C of the Model], XYZ is hereby providing the Insurance Commissioner of [domiciliary state] copies of Management’s Report of Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting for XYZ included in XYZ’s Form 10-K for the fiscal year ended December 31, 201X (or alternatively the Annual Report to Stockholders). In addition, an Addendum (Attachment A) is included to this report which identifies the material processes that were not included in the Section 404 Report (as defined in Attachment A).

ATTACHMENT A

XYZ Holding Company, Inc.

Addendum to Management's Report of Internal Control over Financial Reporting For the Year Ended December 31, 201X

For purposes of this filing, the "Section 404 Report" means Management's Report of Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting contained in or incorporated by reference in the Company's Form 10-K/20-F. Accordingly, as required by [relevant state statute or Section 17C of the Model], management of XYZ hereby affirms that the only material processes with respect to the preparation of the audited statutory financial statements of the Group of insurers that were excluded from the Section 404 Report are the processes discussed below. Management of XYZ hereby affirms that all other material processes with respect to the preparation of the audited statutory financial statements of the Group of insurers were included in the Section 404 Report. The following statutory financial reporting processes were reviewed separately from the internal controls reported by the Group of insurers in its Section 404 report:

Significant Control Processes not tested due to Group Materiality Considerations

The Section 404 report excludes certain control processes deemed material to individual insurance legal entities included within the Group of insurers. This exclusion was due to group materiality decisions made at the parent company level. These processes, and the legal entities within the Group of insurers impacted, are listed as follows:

Workers' Compensation Claims Processing – The HIJ claims processing system is utilized to process workers' compensation claims material to ABC Insurance Subsidiary and DEF Insurance Subsidiary.

Related Party Transactions Eliminated through Consolidation

The Section 404 report does not consider controls surrounding related party transactions as the effects of those transactions are eliminated through consolidation at the holding company financial statement level. Significant related party transactions, and the legal entities within the Group of insurers impacted, are listed as follows:

Affiliate reinsurance agreements – A significant amount of reinsurance coverage is obtained by ABC Insurance Subsidiary and DEF Insurance Subsidiary through contracts with XYZ Parent Company.

Management service agreements – ABC Insurance Subsidiary receives all of its management services through an agreement with XYZ Parent Company.

Tax allocation agreements – ABC Insurance Subsidiary and DEF Insurance Subsidiary are subject to an intercompany tax allocation agreement with XYZ Parent Company.

Deferred Income Taxes

Federal income taxes are provided for XYZ's estimated current and deferred liability. Deferred taxes are provided for differences between the financial statement and tax bases of assets and liabilities. Pursuant to *SSAP No. 101—Income Taxes*, changes in deferred tax assets and liabilities are recognized as a separate component of gains and losses in statutory surplus, while under GAAP/IFRS, these changes are included in income tax expense or benefit. Gross deferred tax assets not meeting the realization criteria outlined in *SSAP No. 101* are not admitted.

Nonadmitted Assets

Certain XYZ assets (principally furniture, equipment, prepaid expenses, agents' balances, and certain deferred tax assets) have been designated as nonadmitted assets under statutory accounting guidance (primarily in *SSAP No. 4—Assets and Nonadmitted Assets* and *SSAP No. 20—Nonadmitted Assets*). Such nonadmitted assets are excluded from assets by a charge to statutory surplus. Under GAAP/IFRS, such amounts are carried at amortized cost with an appropriate valuation allowance, as necessary.

Asset Valuation Reserve (“AVR”)

The AVR represents a statutory contingency reserve for life and health insurers for credit related risk on most invested assets, and is charged to surplus pursuant to *SSAP No. 7—Asset Valuation Reserve and Interest Maintenance Reserve*. No such reserve is required under GAAP/IFRS accounting.

Interest Maintenance Reserve (“IMR”)

The IMR represents the deferral of interest-related realized gains and losses, net of tax, on primarily fixed maturity investments, amortized into income over the remaining life of the investment sold pursuant to *SSAP No. 7—Asset Valuation Reserve and Interest Maintenance Reserve*. No such reserve is required under GAAP/IFRS accounting.

Management of XYZ conducted an assessment of the internal controls over these processes and concluded that they were effective with respect to the audited statutory financial statements.

(Please note that this is not intended to be an all-inclusive list. It should only include material processes that were not covered in the Section 404 Report. The facts and circumstances of each situation will determine the items to be included.)

Management’s Report of Internal Control over Financial Reporting

XYZ Holding Company, Inc. (“XYZ”) is required to file annual reports on Form 10-K/20-F with the U.S. Securities and Exchange Commission. Each of the insurance companies listed on Attachment B is a wholly owned subsidiary of XYZ. For the purpose of XYZ’s Management’s Report of Internal Control over Financial Reporting, management has identified its “Group of insurers,” as that term is defined in [relevant state statute or Section 3H of the Model], as the insurance companies listed on Attachment B.

Management of XYZ is responsible for establishing and maintaining adequate internal control over statutory financial reporting. XYZ’s internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements in accordance with statutory accounting principles. Management conducted an assessment of the effectiveness, as of December 31, 201X, of the Group of insurers’ internal control over statutory financial reporting, based on the framework established in *Internal Control—Integrated Framework Issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO)*. This assessment excluded an evaluation of internal controls over financial reporting for RST Insurance Company which was recently acquired. Based on our assessment under that framework, management concluded that the Group of insurers’ internal control over statutory financial reporting is effective to provide reasonable assurance regarding the reliability of financial reporting and the preparation of statutory financial statements as of December 31, 201X.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Projections of any evaluation of effectiveness to future periods are also subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

In satisfaction of the Group of insurers’ obligation to deliver Management’s Report of Internal Control over Financial Reporting for the fiscal year ended December 31, 201X, as permitted by [relevant state statute or Section 17C of the Model], XYZ is hereby providing the Insurance Commissioner of [domiciliary state] copies of Management’s Report of Internal Control over Financial Reporting and the report of independent registered public accounting firm on internal control over financial reporting for XYZ included in XYZ’s Form 10-K/20-F for the fiscal year ended December 31, 201X (or alternatively the Annual Report to Stockholders). In addition, an Addendum (Attachment A) is included to this report which identifies the material processes that were not included in the Section 404 Report (as defined in Attachment A).

Based on management review of internal controls, there were no unremediated material weaknesses as of December 31, 201X identified as part of the Group of insurers’ internal control structure over the statutory financial statements for the year ended December 31, 201X.

UPDATES

to the

As of March 2022

Accounting Practices and Procedures Manual

Adopted items will be uploaded to this Updates section of the Manual following each interim or national meeting of the Statutory Accounting Principles (E) Working Group.

LAST UPDATED:

- January 27, 2022 – Interim Meeting
- April 4, 2022 – Spring National Meeting

**Revisions to the
As of March 2022, Accounting Practices and Procedures Manual**

On **January 27, 2022**, the Statutory Accounting Principles (E) Working Group adopted the following revisions to the *As of March 2022 Accounting Practices and Procedures Manual*. Documents associated with these revisions are linked to the reference numbers in bold text below.

Ref #	SSAP/ Appendix	Title	Summary
2021-18	SSAP No. 108	VM-21 Scenario Consistency Update <i>SAP Clarification</i> December 31, 2021	Revisions ensure consistency with the <i>Valuation Manual</i> , specifically Section 21, by updating references to the “standard” scenario.”
2021-31	SSAP No. 61R	Life Reinsurance Disclosure Clarifications <i>SAP Clarification</i> December 31, 2021	Revisions clarify and, in some cases, remove certain disclosures for life and health reinsurance contracts. Clarifications also address the information in the audited report.

**Statutory Accounting Principles (E) Working Group
Maintenance Agenda Submission Form
Form A**

Issue: VM-21 Scenario Consistency Update**Check (applicable entity):**

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue:

This agenda item provides a revision to *Statement of Statutory Accounting Principles (SSAP) No. 108—Derivatives Hedging Variable Annuity Guarantees* (SSAP No. 108) to ensure consistency with the Valuation Manual. This agenda item was developed in response to comments from an actuarial firm identifying an existing reference in SSAP No. 108 to the standard scenario in *VM-21: Requirements for Principle-Based Reserves for Variable Annuities* (VM-21). The Life Actuarial (A) Task Force NAIC staff support confirmed that the reference to the standard scenario has been deleted from VM-21.

VM-21 previously applied the standard scenario to all contracts in scope to generate the standard scenario amount. Revisions to VM-21 following the adoption of the Variable Annuity Framework resulted in the elimination of the standard scenario amount. Instead, VM-21 uses the prescribed projections amount, based on either the Company Specific Market Path (CSMP) or Conditional Tail Expectations (CTE) with Prescribed Assumptions (CTEPA). The CSMP and the CTEPA use random sets of scenarios to generate a CTE70 (adjusted) amount. This agenda item proposes using the VM-21 permitted approach that produces the CSMP or CTEPA scenario reserve closest to the CTE70 (adjusted) as the replacement for the standard scenario when determining the Macaulay duration in paragraph 14 of SSAP No. 108.

Existing Authoritative Literature:

SSAP No. 108—Derivatives Hedging Variable Annuity Guarantees provides the following (bolding added for emphasis)

13. Fair value fluctuations in the measurement of outstanding (non-expired) derivatives within a highly effective hedging strategy shall be reflected as follows:
 - a. Fair value fluctuations in the hedging instruments attributable to the hedged risk that offset the current period change in the designated portion of the VM-21 reserve liability⁷ shall be recognized as a realized⁸ gain or loss.

⁷ Hedge effectiveness is determined by comparing fair value fluctuations between the hedging instruments and the hedged item. However, in determining recognition in the financial statements, the fair value fluctuation of the hedging instruments is compared to the change in the reported value of the designated portion of the VM-21 liability. The designated portion of the VM-21 liability is not reported at fair value in the statutory financial statements, as such, the offset reported as realized gains and losses is the portion of the fair value change in hedging instruments offset by the change in the reported value of the designated portion of the VM-21 reserve. In accordance with the documented hedging strategy, reporting entities shall compare the fair value fluctuations to the change in the designated portion of the reserve liability, after considering recognized derivative returns (including recognized derivative income), when determining the recognition of fair value fluctuations.

⁸ Recognizing the fair value change for open derivative positions that offset the VM-21 change as a realized gain/loss (instead of an unrealized gain or loss) directly offsets the VM-21 reserve change in the income statement.

- b. Fair value fluctuations in the hedging instruments attributable to the hedged risk⁹ that do not offset the current period change in the designated portion of the VM-21 reserve liability shall be recognized as deferred assets (admitted) and deferred liabilities. The ability to recognize a deferred asset and deferred liability is limited to only the portion of the fair value fluctuation in the hedging instruments that is attributed to the hedged risk and does not immediately offset changes in the designated portion of the VM-21 reserve liability.

(Drafting Note subparagraphs 13.c. through 13.e. omitted to conserve space.)

14. Deferred assets and deferred liabilities recognized under paragraph 13.b. shall be amortized using a straight-line method into realized gains or realized losses over a finite amortization period. The amortization timeframe shall equal the Macaulay duration of the guarantee benefit cash flows **based on the VM-21 Standard Scenario**, but shall not exceed a period of 10 years.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups): None

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group: None

Convergence with International Financial Reporting Standards (IFRS): Not applicable.

Staff Recommendation:

NAIC staff recommends that the Working Group move this item to the active listing, categorized as nonsubstantive and expose revisions to SSAP No. 108, paragraph 14 as illustrated below. The revision will ensure consistency with VM-21 as it no longer references the standard scenario. With exposure, it is recommended that the Life Actuarial (A) Task Force receive notice of the exposure as part of the coordination process.

14. Deferred assets and deferred liabilities recognized under paragraph 13.b. shall be amortized using a straight-line method into realized gains or realized losses over a finite amortization period. The amortization timeframe shall equal the Macaulay duration of the guarantee benefit cash flows based on the VM-21 ~~Standard Scenario~~ adjusted run scenario that produces the scenario reserve closest to conditional tail expectation (CTE) 70 (adjusted), but shall not exceed a period of 10 years. The CTE 70 (adjusted) and the scenario reserve closest to the CTE 70 (adjusted) are determined using the method (company specific market path (CSMP) or conditional tail expectations (CTE) with prescribed assumptions (CTEPA)) applied by the reporting entity^{FN} to calculate the prescribed projections amount.

New Footnote:

VM-21 allows a reporting entity to choose whether to use the CSMP method or the CTEPA method. Once the choice is made the company cannot change the method without the approval of the commissioner. For the purpose of determining the SSAP No. 108 amortization timeframe, the company shall apply its current method to determine the adjusted run scenario.

Staff Review Completed by: Robin Marcotte, NAIC Staff - October 2021

Status:

On October 25, 2021, in response to an e-vote to expose, the Statutory Accounting Principles (E) Working Group moved this agenda item to the active listing, categorized as nonsubstantive, and exposed revisions to SSAP No.

⁹ The change in fair value of the hedging instruments and hedged item is limited to changes driven by market factors. For example, periodic recognition of a cost owed to acquire the derivative from a counterparty (financing cost) shall not be captured as a change in the derivative instrument's fair value. The fair value of the instrument shall be determined based on the underlying derivative without inclusion of acquisition costs (or other such contractual elements that may exist with the counterparty) that do not change based on the underlying derivative interests or market factors.

108—Derivatives Hedging Variable Annuity Guarantees to ensure consistency with revisions to VM-21, removing references to the standard scenario. The Working Group also provided notice of the exposure to the Life Actuarial (A) Task Force.

On December 11, 2021, Statutory Accounting Principles (E) Working Group exposed revisions, to *SSAP No. 108—Derivatives Hedging Variable Annuity Guarantees*, as illustrated below. The revisions, which incorporate edits proposed from Life Actuarial (A) Task Force representatives, ensure consistency with revisions to VM-21 by removing reference to the standard scenario while adding reference to the conditional tail expectation 70 guidance. This agenda item has a shortened exposure period, ending Jan. 14, 2022, so that the Working Group may consider adoption for year-end 2021 reporting.

Exposed Revisions to SSAP No. 108

14. Deferred assets and deferred liabilities recognized under paragraph 13.b. shall be amortized using a straight-line method into realized gains or realized losses over a finite amortization period. The amortization timeframe shall equal the Macaulay duration of the guarantee benefit cash flows based on the VM-21 Standard ~~Scenario~~Projection (new FN), but shall not exceed a period of 10 years.

New Footnote:

The VM-21 Standard Projection calculation shall be the prescribed assumption run for the scenario that produces the scenario reserve closest to conditional tail expectation (CTE) 70 (adjusted) and a discount rate equal to the valuation interest rate specified by the Standard Valuation Law for annuities valued on an issue year basis, using Plan Type A and a Guarantee Duration greater than 10 years but not more than 20 years. The VM-21 Standard Projection with prescribed assumption run is determined using the method (company specific market path (CSMP) or conditional tail expectations (CTE) with prescribed assumptions (CTEPA)) applied by the reporting entity to calculate the prescribed projections amount. For the CSMP method, the economic scenario is Path A, with the guarantee benefit cash flows from the run to calculate Prescribed Amount A. For the CTEPA method, the economic scenario is the scenario that produces the scenario reserve closest to the CTE70 (Adjusted) from the stochastic reserve calculation, with the guarantee benefit cash flows from the VM-21 Standard Projection with prescribed assumption run for this economic scenario.

On January 27, 2022, the Statutory Accounting Principles (E) Working Group adopted SAP clarifications which update SSAP No. 108 references to be consistent with the *Valuation Manual*, Section 21 with a December 31, 2021, effective date, as detailed below. The adopted revisions included additional changes to the exposed language as recommended by a member of the Life Actuarial (A) Task Force.

Adopted SSAP No. 108 revisions effective December 31, 2021:

14. Deferred assets and deferred liabilities recognized under paragraph 13.b. shall be amortized using a straight-line method into realized gains or realized losses over a finite amortization period. The amortization timeframe shall equal the Macaulay duration of the guarantee benefit cash flows based on the VM-21 Standard ~~Scenario~~Projection (new FN), but shall not exceed a period of 10 years.

New Footnote: The VM-21 Standard Projection benefit cash flows shall be based on the prescribed assumptions run for the scenario that produces the scenario reserve closest to conditional tail expectation (CTE) 70 (adjusted). The VM-21 Standard Projection with prescribed assumptions run is determined using the method (company specific market path (CSMP) or conditional tail expectations with prescribed assumptions (CTEPA)) applied by the reporting entity to calculate the prescribed projections amount. For the CSMP method, the economic scenario is Path A, with the guarantee benefit cash flows from the run to calculate Prescribed Amount A. For the CTEPA method, the economic scenario is the scenario that produces the scenario reserve closest to the CTE70 (adjusted) from the stochastic reserve calculation, with the guarantee benefit cash flows from the VM-21 Standard Projection with prescribed assumptions run for this economic scenario. The discount rate for the Macaulay duration calculation shall be equal to the

valuation interest rate specified by the Standard Valuation Law for annuities valued on an issue year basis, using Plan Type A and a Guarantee Duration greater than 10 years but not more than 20 years.

Issue: Life Reinsurance Disclosure Clarifications**Check (applicable entity):**

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue:

This agenda item is to address questions received from members of the American Institute of Certified Public Accountants (AICPA) NAIC Task Force regarding the life reinsurance disclosures and the related audited notes that were first effective in December 2020. The disclosures were adopted in *SSAP No. 61R—Life, Deposit-Type and Accident and Health Reinsurance* in agenda item 2017-28: Reinsurance Risk Transfer for Short Duration Contracts. Preparers and auditors have highlighted unclear elements in the disclosures that could use additional clarification. Requested clarifications and responses are detailed in the recommendation section, but they include items regarding whether the disclosures apply to ceding and assuming contracts, the format expected for the audited notes and how broadly to interpret the scope of certain disclosures. In the statutory annual statement filing the disclosures are in Note 23H and are not data captured. The proposed revisions to *SSAP No. 61R* narrow the scope of the disclosures and clarify what is required in the disclosures.

Existing Authoritative Literature:

SSAP No. 61R—Life, Deposit-Type and Accident and Health Reinsurance includes the following disclosures:

78. Disclosures for paragraphs 79-84 are required to be included with the annual audit report financial statements beginning with the period ended December 31, 2020, regarding reinsurance contracts. The disclosures required within paragraphs 79-84 shall be included in accompanying supplemental schedules of the annual audit report beginning in year-end 2020. These disclosures shall be limited to reinsurance contracts entered into, renewed or amended on or after January 1, 1996. This limitation applies to the annual audit report only and does not apply to the statutory annual statement interrogatories and the property and casualty reinsurance summary supplemental filing.

79. Disclose any reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) subject to A-791 that includes a provision, which limits the reinsurer's assumption of significant risks identified as in A-791. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. If true, indicate the number of reinsurance contracts to which such provisions apply. For contracts subject to A-791, indicate if deposit accounting was applied for all contracts, which limit significant risks.

80. Disclose any reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) not subject to A-791, for which reinsurance accounting was applied and includes a provision that limits the reinsurer's assumption of risk. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. If true, indicate the number of reinsurance contracts to which such provisions apply. If affirmative, indicate if the reinsurance credit was reduced for the risk-limiting features.

81. Disclose if any reinsurance contracts contain features (except reinsurance contracts with a federal or state facility) described below which result in delays in payment in form or in fact:

- a. Provisions which permit the reporting of losses, or settlements are made, less frequently than quarterly or payments due from the reinsurer are not made in cash within ninety (90) days of the settlement date (unless there is no activity during the period).

- b. Payment schedule, accumulating retentions from multiple years or any features inherently designed to delay timing of the reimbursement to the ceding entity.
82. Disclose if the reporting entity has reflected reinsurance accounting credit for any contracts not subject to Appendix A-791 and not yearly renewable term, which meet the risk-transfer requirements of SSAP No. 61R and identify the type of contracts and the reinsurance contracts.
- a. Assumption Reinsurance – new for the reporting period.
 - b. Non-proportional reinsurance, which does not result in significant surplus relief. If yes, indicate if the insured event(s) triggering contract coverage has been recognized.
83. Disclose if the reporting entity ceded any risk which is not subject to A-791 and not yearly renewable term reinsurance, under any reinsurance contract (or multiple contracts with the same reinsurer or its affiliates) during the period covered by the financial statement, and either:
- a. Accounted for that contract as reinsurance under statutory accounting principles (SAP) and as a deposit under generally accepted accounting principles (GAAP); or
 - b. Accounted for that contract as reinsurance under GAAP and as a deposit under SAP.
84. If affirmative disclosure is required for paragraph 83, explain why the contract(s) is treated differently for GAAP and SAP.

The SSAP No. 61R disclosures were developed based on existing SSAP No. 62R—*Property and Casualty Reinsurance* disclosures with modifications for life and health reinsurance guidance. SSAP No. 62R includes the following disclosures:

113. Disclosures for paragraphs 114-119 represent annual statement interrogatories, which are required to be included with the annual audit report beginning with audit reports on financial statements as of and for the period ended December 31, 2006. The disclosures required within paragraphs 114-119 shall be included in accompanying supplemental schedules of the annual audit report beginning in year-end 2006. These disclosures shall be limited to reinsurance contracts entered into, renewed or amended on or after January 1, 1994. This limitation applies to the annual audit report only and does not apply to the statutory annual statement interrogatories and the reinsurance summary supplemental filing.
114. Disclose if any risks are reinsured under a quota share reinsurance contract with any other entity that includes a provision that would limit the reinsurer's losses below the stated quota share percentage (e.g. a deductible, a loss ratio corridor, a loss cap, an aggregate limit or any similar provisions)? If yes, indicate the number of reinsurance contracts containing such provisions and if the amount of reinsurance credit taken reflects the reduction in quota share coverage caused by any applicable limiting provision(s).
115. Disclose if the reporting entity ceded any risk under any reinsurance contract (or under multiple contracts with the same reinsurer or its affiliates) for which during the period covered by the statement: (i) it recorded a positive or negative underwriting result greater than 5% of prior year-end surplus as regards policyholders or it reported calendar year written premium ceded or year-end loss and loss expense reserves ceded greater than 5% of prior year-end surplus as regards policyholders; (ii) it accounted for that contract as reinsurance and not as a deposit; and (iii) the contract(s) contain one or more of the following features or other features that would have similar results:
- a. A contract term longer than two years and the contract is noncancellable by the reporting entity during the contract term;
 - b. A limited or conditional cancellation provision under which cancellation triggers an obligation by the reporting entity, or an affiliate of the reporting entity, to enter into a new reinsurance contract with the reinsurer, or an affiliate of the reinsurer;
 - c. Aggregate stop loss reinsurance coverage;

- d. A unilateral right by either party (or both parties) to commute the reinsurance contract, whether conditional or not, except for such provisions which are only triggered by a decline in the credit status of the other party;
- e. A provision permitting reporting of losses, or payment of losses, less frequently than on a quarterly basis (unless there is no activity during the period); or
- f. Payment schedule, accumulating retentions from multiple years or any features inherently designed to delay timing of the reimbursement to the ceding entity.

116. Disclose if the reporting entity during the period covered by the statement ceded any risk under any reinsurance contract (or under multiple contracts with the same reinsurer or its affiliates) for which it recorded a positive or negative underwriting result greater than 5% of prior year-end surplus as regards policyholders or it reported calendar year written premium ceded or year-end loss and loss expense reserves ceded greater than 5% of prior year-end surplus as regards policyholders. This disclosure is limited to reinsurance contracts with written premium cessions or loss and loss expense reserve cessions described in this paragraph that meet the criteria of paragraph 116.a. or paragraph 116.b. This disclosure excludes cessions to approved pooling arrangements or to captive insurance companies that are directly or indirectly controlling, controlled by, or under common control with (i) one or more unaffiliated policyholders of the reporting entity, or (ii) an association of which one or more unaffiliated policyholders of the reporting entity is a member.

- a. The written premium ceded to the reinsurer by the reporting entity or its affiliates represents fifty percent (50%) or more of the entire direct and assumed premium written by the reinsurer based on its most recently available financial statement; or
- b. Twenty-five percent (25%) or more of the written premium ceded to the reinsurer has been retroceded back to the reporting entity or its affiliates in separate reinsurance contract.

117. If affirmative disclosure is required for paragraph 115 or 116, provide the following information:

- a. A summary of the reinsurance contract terms and indicate whether it applies to the contracts meeting paragraph 115 or 116;
- b. A brief discussion of management's principal objectives in entering into the reinsurance contract including the economic purpose to be achieved; and
- c. The aggregate financial statement impact gross of all such ceded reinsurance contracts on the balance sheet and statement of income.

118. Except for transactions meeting the requirements of paragraph 36, disclose if the reporting entity ceded any risk under any reinsurance contract (or multiple contracts with the same reinsurer or its affiliates) during the period covered by the financial statement, and either:

- a. Accounted for that contract as reinsurance (either prospective or retroactive) under statutory accounting principles (SAP) and as a deposit under generally accepted accounting principles (GAAP); or
- b. Accounted for that contract as reinsurance under GAAP and as a deposit under SAP.

119. If affirmative disclosure is required for paragraph 118, explain in a supplemental filing why the contract(s) is treated differently for GAAP and SAP.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups):

Agenda item 2017-28 adopted the SSAP No. 61R disclosures in paragraphs 78-84. The disclosures were developed at the request of the Financial Analysis (E) Working Group and were based on existing disclosures in *SSAP No. 62R—Property and Casualty Reinsurance* in paragraphs 114-119 that are designed to identify contracts with risk

limiting features or other items that may need additional regulatory review. The disclosures had to be modified to meet the requirements of SSAP No. 61R and *Appendix A-791- Life and Health Reinsurance Agreements*

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group:
None

Convergence with International Financial Reporting Standards (IFRS): None

Staff Recommendation:

NAIC staff recommends that the Working Group move this item to the active listing, categorized as nonsubstantive and expose the revisions to SSAP No. 61R disclosures illustrated below. These items are recommended for a shortened comment period to allow for possible adoption in early 2022 with a year-end 2021 effective date. The proposed revisions provide clarifications and, in some cases, narrow the scope of disclosure. No additional disclosures are proposed. Having the disclosure revisions final for year-end 2021 will assist preparers and auditors.

1. Does the Statutory Accounting Principles (E) Working Group expect the disclosures to be filed as a supplemental schedule in the audited financial statements even when all answers are not applicable or none? **(This is the most common question that the auditing firms received.)**

Response: If there are no contracts with the applicable features, a narrative note would be sufficient. See suggested edit to paragraph 78 which provides that the information can be in a note or a supplemental schedule. NAIC staff notes that Note 23H is not data captured in the statutory annual statement filing.

2. Is the supplemental schedule specific to ceded reinsurance only?

Response: While some of the disclosures are primarily designed to identify ceding contracts which may require additional scrutiny to verify that too large of a reinsurance credit was taken by the ceding entity, the scope of the disclosures includes all reinsurance contracts unless specifically identified otherwise. See proposed clarifications to limit paragraphs 79 and 80 to ceding contracts. This clarification would be similar to corresponding paragraphs in SSAP No. 62. Also, a clarification also specifies that paragraph 81 is applicable to both assumed and ceding contracts.

3. With regard to paragraph 80, would a stop loss or excess of loss reinsurance agreement with a loss cap or with deductibles (which are common contractual provisions) be required to be disclosed?

Response: Paragraph 80 provides the following:

80. Disclose any reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) not subject to A-791, for which reinsurance accounting was applied and includes a provision that limits the reinsurer's assumption of risk. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. If true, indicate the number of reinsurance contracts to which such provisions apply. If affirmative, indicate if the reinsurance credit was reduced for the risk-limiting features.

Paragraph 80 is a modification of the following SSAP No. 62R disclosure:

114. Disclose if any risks are reinsured under a quota share reinsurance contract with any other entity that includes a provision that would limit the reinsurer's losses below the stated quota share percentage (e.g. a deductible, a loss ratio corridor, a loss cap, an aggregate limit or any similar provisions)? If yes, indicate the number of reinsurance contracts containing such provisions and if the amount of reinsurance credit taken reflects the reduction in quota share coverage caused by any applicable limiting provision(s).

Response: Paragraph 80 was modified to capture contracts not subject to A-791 and not quota share contracts as shown in SSAP No. 62R, paragraph 114 because the requirements of A-791 do not allow significant risks which are required to be ceded to be limited. As currently drafted, the disclosure is written too broadly in that it may be capturing more nonproportional contracts with “standard” features than what is useful. See proposed clarification to paragraph 80 in the illustration below to remove stop loss or excess of loss reinsurance agreements with deductibles or loss caps that apply to the entire contract and are not adjustable based on other features from the disclosure.

4. Please clarify the intent and what information should be disclosed in subparagraphs 82.a. and 82.b.
 - a. We thought that for paragraph 82.a., the intent related to ceding companies with assumption reinsurance agreements (paragraph 60 of SSAP 61R) entered into during the current year for which indemnity reinsurance is being applied for policyholders who have not yet agreed to the transfer to the new insurer or for which the regulator has not yet approved the novation to the new insurer.

Response: Paragraph 82.a. is intended to reference assumption reinsurance agreements referenced in paragraph 60 of SSAP No. 61R entered into during the current year for which reinsurance credit is reported. It does not make a distinction regarding those that have or have not been approved by the policyholder. A simple reading of the disclosure is intended - to identify new assumption reinsurance agreements. This paragraph does not have a similar paragraph in SSAP No. 62R. See edits to SSAP No. 61R illustrated below which add reference to the contracts in paragraph 60.

- b. With regard to paragraph 82.b., what is the concern related to non-proportionate contracts that do not provide significant surplus relief?

Response: Paragraph 82. b is proposed for deletion, as it does not provide useful information. This is because it would require disclosure of contracts which do not provide significant surplus relief and it is unclear what types of assumption reinsurance would be captured. This paragraph does not have a similar paragraph in SSAP No. 62R. See edits to SSAP No. 61R illustrated below.

5. How should an entity answer paragraphs 83-84 if no GAAP financial statements are prepared?

Response: If the reporting entity and or its holding company group does not prepare GAAP financials this is not an analysis that would be required. See proposed clarification in paragraph 83 below. AICPA representatives noted, and NAIC staff agrees, that because of A-791 differences there may be more life and health contracts reported differently for GAAP.

Recommended Revisions to SSAP No. 61R:

78. Disclosures for paragraphs 79-84 are required to be included with the annual audit report financial statements beginning with the period ended December 31, 2020, regarding reinsurance contracts. The disclosures required within paragraphs 79-84 ~~shall~~ can be included in accompanying supplemental schedules or the notes of the annual audit report beginning in year-end 2020. If not applicable, an affirmative statement that no such contracts were identified is acceptable. These disclosures shall be limited to reinsurance contracts entered into, renewed or amended on or after January 1, 1996. This limitation applies to the annual audit report only and does not apply to the statutory annual statement interrogatories and the property and casualty reinsurance summary supplemental filing.

79. Disclose any ceding reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) subject to A-791 that includes a provision, which limits the reinsurer’s assumption of significant risks identified as in A-791. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. If true, indicate the number of reinsurance contracts to which such provisions apply. For contracts subject to A-791, indicate if deposit accounting was applied for all contracts, which limit significant risks.

80. Disclose any ceding reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) not subject to A-791, for which reinsurance accounting was applied and includes a provision that limits the reinsurer's assumption of risk. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. Note that a stop loss or excess of loss reinsurance agreement with deductibles or loss caps which apply to the entire contract and are not adjustable based on other features, do not require disclosure under this paragraph. If true, indicate the number of reinsurance contracts to which such provisions apply. If affirmative, indicate if the reinsurance credit was reduced for the risk-limiting features.

81. Disclose if any assumed or ceded reinsurance contracts contain features (except reinsurance contracts with a federal or state facility) described below which result in delays in payment in form or in fact:

- a. Provisions which permit the reporting of losses, or settlements are made, less frequently than quarterly or payments due from the reinsurer are not made in cash within ninety (90) days of the settlement date (unless there is no activity during the period).
- b. Payment schedule, accumulating retentions from multiple years or any features inherently designed to delay timing of the reimbursement to the ceding entity.

82. Disclose if the reporting entity has reflected reinsurance accounting credit for any contracts not subject to Appendix A-791 and not yearly renewable term, which meet the risk-transfer requirements of SSAP No. 61R and identify the type of contracts and the reinsurance contracts.

- a. Assumption Reinsurance – as discussed in paragraph 60, which are new for the reporting period.
- ~~b. Non-proportional reinsurance, which does not result in significant surplus relief. If yes, indicate if the insured event(s) triggering contract coverage has been recognized.~~

83. Disclose if the reporting entity ceded any risk which is not subject to A-791 and not yearly renewable term reinsurance, under any reinsurance contract (or multiple contracts with the same reinsurer or its affiliates) during the period covered by the financial statement, and either:

- a. Accounted for that contract as reinsurance under statutory accounting principles (SAP) and as a deposit under U.S. generally accepted accounting principles (GAAP); or
- b. Accounted for that contract as reinsurance under U.S. GAAP and as a deposit under SAP.

If the reporting entity does not prepare U.S. GAAP financial statements or its financial statements are not part of upstream U.S. GAAP financial statements, this disclosure can be answered not applicable.

84. If affirmative disclosure is required for paragraph 83, explain why the contract(s) is treated differently for GAAP and SAP.

Staff Review Completed by: Robin Marcotte, NAIC Staff - November 2021

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this item to the active listing, categorized as nonsubstantive, and exposed revisions to SSAP No. 61R, as illustrated above. These revisions intend to clarify, and in some cases, narrow the scope of certain disclosures. This agenda item has a shortened exposure period, ending Jan. 14, 2022, so that the Working Group may consider adoption for year-end 2021 reporting.

On January 27, 2022, the Statutory Accounting Principles (E) Working Group adopted SAP clarifications which update the SSAP No. 61R disclosures with a December 31, 2021, effective date, as detailed below. The adopted revisions included additional changes to the exposed language as recommended by members of the ACIPA's NAIC Task Force and interested parties.

Adopted Revisions to SSAP No. 61R:

78. Disclosures for paragraphs 79-84 apply to reinsurance contracts in effect for the current period covered by the statement and are required to be included with the annual audit report financial statements beginning with the period ended December 31, 2020, regarding reinsurance contracts. The disclosures required within paragraphs 79-84 shall be included in accompanying supplemental schedules of the annual audit report beginning in year-end 2020. If the disclosures are not applicable, an affirmative statement that no such contracts were identified is acceptable in the notes to the financial statements or the supplemental schedules. These disclosures shall be limited to reinsurance contracts entered into, renewed or amended on or after January 1, 1996. This limitation applies to the annual audit report only and does not apply to the statutory annual statement interrogatories and the property and casualty reinsurance summary supplemental filing.

79. Disclose any ceded reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) subject to A-791 that includes a provision, which limits the reinsurer's assumption of significant risks identified as in A-791. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. If true, indicate the number of reinsurance contracts to which such provisions apply. For contracts subject to A-791, indicate if deposit accounting was applied for all contracts, which limit significant risks.

80. Disclose any ceded reinsurance contracts (or multiple contracts with the same reinsurer or its affiliates) not subject to A-791, for which reinsurance accounting was applied and includes a provision that limits the reinsurer's assumption of risk. Examples of risk-limiting features include provisions such as a deductible, a loss ratio corridor, a loss cap, an aggregate limit or similar effect. Note that a stop loss or excess of loss reinsurance agreement with deductibles or loss caps which apply to the entire contract and are not adjustable based on other features, do not require disclosure under this paragraph. If true, indicate the number of reinsurance contracts to which such provisions apply. If affirmative, indicate if the reinsurance credit was reduced for the risk-limiting features.

81. Disclose if any ceded reinsurance contracts contain features (except reinsurance contracts with a federal or state facility) described below which result in delays in payment in form or in fact:

- a. Provisions which permit the reporting of losses, or settlements are made, less frequently than quarterly or payments due from the reinsurer are not made in cash within ninety (90) days of the settlement date (unless there is no activity during the period).
- b. Payment schedule, accumulating retentions from multiple years or any features inherently designed to delay timing of the reimbursement to the ceding entity.

82. Disclose if the reporting entity has reflected reinsurance accounting credit for any contracts not subject to Appendix A-791 and not yearly renewable term, which meet the risk-transfer requirements of SSAP No. 61R and identify the type of contracts and the reinsurance contracts.

- a. Assumption Reinsurance – as discussed in paragraph 60, which are new for the reporting period.
- ~~b. ——— Non-proportional reinsurance, which does not result in significant surplus relief. If yes, indicate if the insured event(s) triggering contract coverage has been recognized.~~

83. Disclose if the reporting entity ceded any risk which is not subject to A-791 and not yearly renewable term reinsurance, under any reinsurance contract (or multiple contracts with the same reinsurer or its affiliates) during the period covered by the financial statement, and either:

- a. Accounted for that contract as reinsurance under statutory accounting principles (SAP) and as a deposit under U.S. generally accepted accounting principles (GAAP); or
- b. Accounted for that contract as reinsurance under U.S. GAAP and as a deposit under SAP.

If the reporting entity does not prepare U.S. GAAP financial statements or its financial statements are not part of upstream U.S. GAAP financial statements, this disclosure can be answered not applicable.

84. If affirmative disclosure is required for paragraph 83, explain why the contract(s) is treated differently for GAAP and SAP.

Not for Distribution

**Revisions to the
As of March 2022, Accounting Practices and Procedures Manual**

On **April 4, 2022**, the Statutory Accounting Principles (E) Working Group adopted the following revisions to the *As of March 2022 Accounting Practices and Procedures Manual*. Documents associated with these revisions are linked to the reference items in bold text.

Ref #	SSAP/ Appendix	Title	Summary
2021-22	SSAP No. 97	Schedule D-6-1, Supplemental Reporting No Statutory Revisions	Agenda item did not result in statutory revisions; however, adoption expressed support for a corresponding Blanks (E) Working Group proposal (2022-02BWG) to add supplemental data capture elements in <i>Schedule D – Part 6 – Section 1: Valuation of Shares of Subsidiary, Controlled or Affiliated Entities</i> .
2021-23	SSAP No. 43R	SSAP No. 43R – Financial Modeling, Updated Guidance <i>SAP Clarification</i> Effective Immediately (April 4, 2022)	Revisions update the summarized financial modeling guidance and refers users to the <i>Purposes and Procedures Manual of the NAIC Investment Analysis Office</i> , for the detailed financial modeling guidance.
2021-24	SSAP No. 2R	Cryptocurrency General Interrogatory No Statutory Revisions	Agenda item did not result in statutory revisions; however, adoption expressed support for a corresponding Blanks (E) Working Group proposal (2022-01BWG) to add a new general interrogatory regarding the use or acceptance of cryptocurrencies
2021-26EP	Various	Editorial Updates (Substantive vs. Nonsubstantive) <i>SAP Clarification</i> Effective Immediately (April 4, 2022)	Revisions to the Preamble, Table of Contents, Summary of Changes, and Appendix F to reflect recently adopted guidance (agenda item 2021-14: SAP Terminology) to replace the terms “substantive” and “nonsubstantive.”
2021-27	SSAP No. 72	ASU 2021-04, Accounting for Certain Modifications <i>SAP Clarification</i> Effective Immediately (April 4, 2022)	Revisions incorporate guidance related to the accounting for the changes in fair value when exchanging equity-classified written call options, while rejecting ASU 2021-04 for statutory accounting.

Ref #	SSAP/ Appendix	Title	Summary
2021-28	SSAP No. 68	ASU 2021-03, Intangibles - Goodwill <i>SAP Clarification</i> Effective Immediately (April 4, 2022)	Revisions reject ASU 2021-03 for statutory accounting.
2021-29	SSAP No. 22R	ASU 2021-05, Variable Lease Payments <i>SAP Clarification</i> Effective Immediately (April 4, 2022)	Revisions reject ASU 2021-05 for statutory accounting.
2021-30	Appendix D	ASU 2021-06, Amendments to SEC Paragraphs <i>SAP Clarification</i> Effective Immediately (April 4, 2022)	Revisions reject ASU 2021-06 for statutory accounting.

**Statutory Accounting Principles (E) Working Group
Maintenance Agenda Submission Form
Form A**

Issue: Schedule D-6-1, Supplemental Reporting

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue: *SSAP No. 97—Investments in Subsidiary, Controlled and Affiliated Entities* defines the specific criteria for when an investment is considered a subsidiary, controlled or affiliated entity (SCA) for statutory accounting purposes. Broadly defined, SCAs are entities that are 1) directly or indirectly owned or controlled by a reporting entity (i.e., a subsidiary), or 2) within a holding company system or a party that is directly or indirectly, through one or more intermediaries, in which controls, is controlled by, or is under common control with a reporting entity (i.e., an affiliate). While SSAP No. 97 offers varying classifications of SCAs with differing valuation methods, all SCAs are ultimately reported on *Schedule D – Part 6 – Section 1: Valuation of Shares of Subsidiary, Controlled or Affiliated Entities*.

The reporting requirements for SCAs is defined in SSAP No. 97, Exhibit A, however in general, the process is as follows: (note: the following comments are not applicable for domestic SCA insurance companies)

- All SCA entities, regardless of if they are nonadmitted, have a zero value, or are immaterial to the reporting entity, must file a “Sub-1” within 90 days of the acquisition or formation of the investment. The Sub-1 filing is to gather basic information about the SCA and is used to determine if the transaction meets certain specific criteria specified within SSAP No. 97.
- Annually, but no later than August 31 (or one month after the audit report is issued for an SCA – for entities who routinely received their audit reports after August 31), SCAs must file a “Sub-2” filing. This filing details the valuation method utilized; the value claimed in Schedule D-6-1 and includes all required supporting documentation. (Nonadmitted assets are not required to file a Sub-2 if they are nonadmitted, or had a zero value, for the full reporting period). The Sub-2 filing is then reviewed by the NAIC for verification of the claimed value. If required, valuation adjustments are made. As directed in SSAP No 97, **if the insurance company has reported a value for a SCA investment on its financial statement blank that differs from the value approved by the NAIC, the insurer is required to adjust the reported value in its next quarterly financial statement blanks, unless otherwise directed by the insurer’s state of domicile.** (Note, the SCA review process occurs in arrears. As such, when a value is adjusted, the concepts for the adjustment shall be applied to the next year-end. For example, if a company did not incorporate required SSAP No. 97 adjustments in determining the reported value as of Dec. 31, 2020, those adjustments should be considered when determining the value reported as of Dec. 31, 2021 (or earlier if known when the quarterly financials are completed). When the adjustment is material, then the guidance in *SSAP No. 3—Accounting Changes and Corrections of Errors* would be applicable.)

In 2019, the NAIC reviewed 824 SCA filings (which includes both Sub-1 and Sub-2 filings). Of the total, 720 were Sub-2 filings (the filing in which a value is approved). Of the 720 Sub-2 filings, 125 (approx. 17%) resulted in *valuation decreases*. Presumably, per SSAP No. 97, entities (unless directed by their state of domicile) adjusted the reported values in their next quarterly financial statements, however NAIC staff have found that it is not uncommon for the same entities, year after year, to have approved values that vary significantly from their reported balances. It is also important to note that while the NAIC does send monthly reports on SCA activity to state regulators, the process of reviewing the activity reports and verifying compliance with SSAP No. 97, for state regulators (and NAIC staff) is operationally onerous. Accordingly, this agenda item has been drafted to propose new supplemental

reporting (in electronic only columns) to assist state regulators to 1) ensure Sub-1 and Sub-2 filings are being submitted by reporting entities, and 2) identify situations where the NAIC approved value varies significantly from the value reported on Schedule D-6-1.

Existing Authoritative Literature:

Staff note – For completeness of the document, the authoritative guidance defining SCA’s in scope of SSAP No. 97 has been included herein. Certain relevant items have been bolded for emphasis.

SSAP No. 97—Investments in Subsidiary, Controlled and Affiliated Entities

Definition [of a SCA]

1. Parent and subsidiary are defined as follows:
 - a. Parent—An entity that directly or indirectly owns and controls the reporting entity;
 - b. **Subsidiary—An entity that is, directly or indirectly, owned and controlled by the reporting entity.**
2. **An affiliate is defined as an entity that is within the holding company system or a party that, directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with the reporting entity.** An affiliate includes a parent or subsidiary and may also include partnerships, joint ventures, and limited liability companies as defined in *SSAP No. 48—Joint Ventures, Partnerships and Limited Liability Companies*. Those entities are accounted for under the guidance provided in SSAP No. 48, which requires an equity method for all such investments.
3. **Control is defined as the possession, directly or indirectly, of the power to direct or cause the direction of the management and policies of the investee,** whether through the (a) ownership of voting securities, (b) by contract other than a commercial contract for goods or nonmanagement services, (c) by common management, or (d) otherwise. Control shall be presumed to exist if a reporting entity and its affiliates directly or indirectly, own, control, hold with the power to vote, or hold proxies representing 10% or more of the voting interests of the entity.
4. Control as defined in paragraph 5 shall be measured at the holding company level. For example, if one member of an affiliated group has a 5% interest in an entity and a second member of the group has an 8% interest in the same entity, the total interest is 13% and therefore each member of the affiliated group shall be presumed to have control. This presumption will stand until rebutted by an evaluation of all the facts and circumstances relating to the investment based on the criteria in *FASB Interpretation No. 35, Criteria for Applying the Equity Method of Accounting for Investments in Common Stock, an Interpretation of APB Opinion No. 18*. The corollary is required to demonstrate control when a reporting entity owns less than 10% of the voting securities of an investee. The insurer shall maintain documents substantiating its determination for review by the domiciliary commissioner. An investment in an SCA entity may fall below the level of ownership described in paragraph 5, in which case, the reporting entity would discontinue the use of the equity method, as prescribed in paragraph 13.g. Additionally, through an increase in the level of ownership, a reporting entity may become qualified to use the equity method of accounting (paragraph 8.b.), in which case, the reporting entity shall add the cost of acquiring additional interest to the current basis of the previously held interest and shall apply the equity method prospectively, as of the date the investment becomes qualified for equity method accounting. Examples of situations where the presumption of control may be in doubt include the following:
 - a. Any limited partner investment in a limited partnership, unless the limited partner is affiliated with the general partner.
 - b. An entity where the insurer owns less than 50% of an entity and there is an unaffiliated individual or group of investors who own a controlling interest.

- c. An entity where the insurer has given up participating rights as a shareholder to the investee.
5. Investments in SCA entities meet the definition of assets as defined in *SSAP No. 4—Assets and Nonadmitted Assets* and are admitted assets to the extent they conform to the requirements of this statement.

EXHIBIT A – SCA REPORTING PROCESS

50. **SCA entities, except for domestic SCA insurance company investments accounted for under paragraph 8.b.i of this statement, in which the reporting entity has an equity interest (common or preferred stock), are required to be filed with the NAIC. Nonadmitted assets are not required to be filed in a Sub-2 as long as they were nonadmitted, or had a zero value, for the full reporting period (all interim and annual reporting).** Immaterial asset SCAs do not have an automatic exclusion from filing, as immateriality of an SCA will be ascertained by the state of domicile of the insurance reporting entity, but companies are allowed to request an exemption from the domiciliary state to not file an SCA on the basis that it is immaterial. The filing process does not include investments within the scope of *SSAP No. 48*.

51. **Except for domestic SCA insurance company investments accounted for under paragraph 8.b.i., all SCA investments within the scope of this statement, purchased during any one calendar year, shall be reported to the NAIC on a Sub-1 form within 90 days of the acquisition or formation of the investment; this includes nonadmitted, zero-valued and immaterial SCAs.** The NAIC will process that filing in the same year but will not at that time approve or disapprove a value for the SCA investment. **By August 31 of each year, the insurance company shall submit a Sub-2 filing for the previously purchased SCA investment reported on a Sub-1 form and later that year, the NAIC will approve a value for the transaction.** For SCAs that routinely receive their audit reports after the August 31 deadline, a filing deadline of one month after the audit date shall be applied. Filers must provide previous years' audit reports to verify an audit report dated after August 31 in order to not be charged a late fee for a Sub-2 filing that is filed after the August 31 deadline. The value approved by the NAIC at the conclusion of the Sub-2 form filing is reported by the insurance company on its financial statement blank. If the insurance company has reported a value for the SCA investment on its financial statement blank that differs from the value approved by the NAIC, the insurer is required to adjust the reported value in its next quarterly financial statement blank unless otherwise directed by the insurer's state of domicile.

52. Insurance companies shall use one of the valuation methods described in paragraph 8 to calculate the value of their investments in insurance and non-insurance SCA companies. An insurance company shall calculate the value of its investments in foreign insurance and all non-insurance company SCA entities and report the value to the NAIC no later than August 31, or one month after the audit report date for SCAs that routinely receive their audits after August 31 for existing SCA investments, and within 90 days of the acquisition or formation of a new SCA investment.

Initial Reporting of SCA Investments

53. Reporting the acquisition or formation of a new investment is accomplished by submitting a completed Sub-1 form for each investment, disclosing (i) the valuation reported or to be reported by the insurance company on its latest or next quarterly financial statement blank, (ii) which method of those described in paragraph 8 was used to arrive at the valuation, (iii) the factual context of the transaction and (iv) economic and business motivations for the transaction. The submission will be processed by the NAIC only if the NAIC determines it has been provided with all material information with respect to all SCA companies of the reporting insurance company that require valuation.

54. **The purpose of a Sub-1 filing is to gather basic information about the SCA.** If the NAIC determines that the reported transaction meets the tests specified, it will complete the filing in the VISION database. If the NAIC determines that the transaction does not meet the tests specified, it will not complete the filing in the VISION database and instead shall notify the reporting insurance company and the state of domicile in writing of its determination.

Subsequent Reporting of SCA Investments

55. **By August 31 or one month after the audit report date of each year and subsequent to the reporting of an SCA investment on the Sub-1 form, the insurance company shall submit a Sub-2 form filing, with all supporting documentation for foreign SCAs provided in English, for the same SCA investment. Additionally, by August 31 or one month after the audit report date of each year, any insurance company that has made a Sub-2 form filing in a previous year must update the information by filing an updated Sub-2 form filing.**

56. Each year the NAIC shall compile a list of all SCA investments (excluding insurance company SCAs (paragraph 8.b.i.) nonadmitted and zero-value SCAs) reported as Sub-1 form filings for which a Sub-2 form filing has not yet been received. For these transactions, the NAIC will notify the responsible reporting insurance company and its state of domicile that it has not received a Sub-2 filing for the SCA investment.

57. **The purpose of the Sub-2 filing is to determine whether the value calculated by the reporting insurance company for the SCA investment is appropriate and to approve that or some other value for reporting on the insurer's financial statement blank.**

58. An insurance company that concludes an SCA transaction at year-end may be unable to file a Sub-1 form prior to the time it would be required to file a Sub-2 form. Where this is the case, the NAIC is authorized to accept and review a Sub-1 filing from such an insurance company and to accept and review the Sub-2 filing after the Sub-1 filing review has been completed.

59. No filing of an investment in a domestic SCA insurance company valued under paragraph 8.b.i. shall be required to be made with the NAIC.

Assessment and Review of Sub-2 Form

64. By August 31 or one month after the audit report date of each year, the NAIC shall initiate a review of all SCA investments for which new Sub-2 form filings have been received as well as an annual update review of Sub-2 SCA investments already logged in the VISION database. **The NAIC review shall encompass a review of the most recent annual statutory reporting by the parent insurance company's Schedule Y (to ascertain the identity of the members of the holding company system and to ensure that information for all SCA companies has been submitted), a review of the parent's financial statement blank to review the last reported value for the SCA investments and a review of the VISION database to determine whether SCA debt and SCA preferred securities have been assigned NAIC designations.** As part of its analysis, the NAIC shall review the portion of the bond investments carried by the parent or a subsidiary insurer with a **Z** notation. If the NAIC determines that the portion of the **Z** bonds shown on the documentation is significant, the NAIC shall not process the Sub-2 filing until the insurance company reports the bonds to permit removal of the **Z** notation. Beginning with year-end 2019, two new suffixes will apply: **YE** and **IF**. **YE** means that the security is a properly filed annual update that the SVO has determined will not be assigned an NAIC designation by the close of the year-end reporting cycle. The symbol **YE** is assigned by the SVO pursuant to the carryover administrative procedure described in Part One, Section 3 f) (iii) of the *Purposes and Procedures Manual of the NAIC Investment Analysis Office*. When the SVO assigns the symbol **YE** it also assigns the NAIC designation in effect for the previous reporting year. **IF** means that the security is an initial filing that has been properly filed with the SVO but which the SVO has determined will not be assigned an NAIC designation by the close of the year-end reporting cycle. The symbol **IF** is assigned by the SVO and communicates that the insurer should self-designate the security for year-end and identify it with the symbol **IF**. **IF**, therefore, also communicates to the regulator that the NAIC designation reported by the insurance company was not derived by or obtained from the SVO, but has been determined analytically by a reporting insurance company.

65. **Upon completion of the procedures described above, the NAIC will determine whether the value reported by the insurance company on the current SCA filing was calculated in accordance with the instructions for the valuation method chosen and verify that the filed value reflects the adjustments required by paragraph 9.**

Reporting Instructions for Schedule D, Part 6, Section 1

Column 1	–	CUSIP Identification
Column 2	–	Description
Column 3	–	Foreign
Column 4	–	NAIC Company Code
Column 5	–	ID Number
Column 6	–	NAIC Valuation Method
Column 8	–	Total Amount of Goodwill
Column 9	–	Nonadmitted Amount
Column 10	–	Stock of Such Company Owned by Insurer on Statement Date Number of Shares and
Column 11	–	Stock of Such Company Owned by Insurer on Statement Date % of Outstanding

**** Column 12 through 159 will be electronic only. ****

Column 12 – Legal Entity Identifier (LEI)

Column 13 – Issuer

Column 14 – Issue

Column 15 – ISIN Identification

Column 16 – Prior Year BACV

Column 17 – Prior Year Nonadmitted Amount

Provide the amount nonadmitted, if any, included in Column 4 of the Asset page.

Column 18 – Prior year Sub-2 Verified Value

If per SSAP No. 97 or by direction of the domiciliary regulator, the SCA is required to be filed with the NAIC, provide the prior year's Sub-2 'Total Value Claimed.'

Column 18 – Prior year VISION Filing Number

If per SSAP No. 97 or by direction of the domiciliary regulator, the SCA is required to be filed with the NAIC, provide the prior year NAIC VISION filing number.

Staff Review Completed by: Jim Pinegar, NAIC Staff – November 2021

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this item to the active listing and exposed proposed revisions to be incorporated into a Blanks (E) Working Group proposal which would supplement the reporting of SCA investments reported in Schedule D-6-1, as illustrated above. The supplemental data to be captured is consistent with current requirements in SSAP No. 97 and as a result, the agenda item did not propose statutory revisions.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted this agenda item, which did not result in statutory accounting revisions, however adoption expressed support of the corresponding Blanks (E) Working Group proposal (2022-02BWG), which incorporates new electronic only columns in Schedule D-6-1. The supplemental data to be captured is consistent with current requirements in SSAP No. 97.

**Statutory Accounting Principles (E) Working Group
Maintenance Agenda Submission Form
Form A**

Issue: SSAP No. 43R – Financial Modeling – Updated Guidance

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue: This agenda item reflects updated NAIC designation/NAIC designation category guidance recently adopted by the Valuation of Securities (E) Task Force (VOSTF) to the *Purposes and Procedures Manual of the NAIC Investment Analysis Office (P&P Manual)*, for residential mortgage-backed securities (RMBS) and commercial mortgage-backed securities (CMBS).

On October 20, 2021, the VOSTF adopted instructions to the P&P Manual to designate that 1) modeled RMBS/CMBS tranches that do not have expected losses will be assigned an NAIC 1 Designation and a NAIC 1.A. Designation Category, and 2) financial modeling for “legacy” RMBS/CMBS securities (those that closed prior to January 1, 2013), shall continue to utilize the insurer’s carrying value for said modeling.

This agenda item has been drafted to ensure the financial modeling guidance summarized in *SSAP No. 43R—Loan-Backed and Structured Securities* reflects the practices as directed by the P&P Manual. (Note, while the *Accounting Practices and Procedures Manual* is higher than the P&P manual in the statutory hierarchy, the primary source of authoritative guidance for financial modeling is the P&P manual as only a general description of the modeling process is included in SSAP No. 43R).

Existing Authoritative Literature:

SSAP No. 43R—Loan-Backed and Structured Securities

Designation Guidance

27. For RMBS/CMBS securities within the scope of this statement, the initial NAIC designation used to determine the carrying value method and the final NAIC designation for reporting purposes is determined using a multi-step process. The P&P Manual provides detailed guidance. A general description of the processes is as follows:
 - a. Financial Modeling: Pursuant to the P&P Manual, the NAIC identifies select securities where financial modeling must be used to determine the NAIC designation. NAIC designation based on financial modeling incorporates the insurers’ carrying value for the security. For those securities that are financially modeled, the insurer must use NAIC CUSIP specific modeled breakpoints provided by the modelers in determining initial and final designation for these identified securities. As specified in the P&P Manual, securities where modeling results in zero expected loss in all scenarios and that would be equivalent to an NAIC designation and NAIC designation category of NAIC 1 and NAIC 1.A. respectively, if the filing exemption process in the P&P Manual was applied, are automatically considered to have a final NAIC designation of NAIC 1 and NAIC designation category of NAIC 1.A., regardless of the carrying value. The three-step process for modeled securities is as follows:
 - i. Step 1: Determine Initial Designation – The current amortized cost (divided by remaining par amount) of a loan-backed or structured security is compared to the modeled breakpoint values assigned to the six (6) NAIC designations for each CUSIP to establish the initial NAIC designation.

- ii. Step 2: Determine Carrying Value Method – The carrying value method, either the amortized cost method or the lower of amortized cost or fair value method, is then determined as described in paragraph 26 based upon the initial NAIC designation from Step 1.
 - iii. Step 3: Determine Final Designation – The final NAIC designation is determined by comparing the carrying value (divided by remaining par amount) of a security (based on paragraph 27.a.ii.) to the NAIC CUSIP specific modeled breakpoint values assigned to the six (6) NAIC designations for each CUSIP. The final designation is mapped to an NAIC designation category according to the instructions in the P&P Manual. This final NAIC designation shall be applicable for statutory accounting and reporting purposes and the NAIC designation category will be used for investment schedule reporting and establishing RBC and AVR charges. The final NAIC designation is not used for establishing the appropriate carrying value method in Step 2 (paragraph 27.a.ii.).
- b. All Other Loan-Backed and Structured Securities: For securities not subject to paragraph 27.a. (financial modeling) follow the established designation procedures according to the appropriate section of the P&P Manual. The NAIC designation shall be applicable for statutory accounting and reporting purposes (including determining the carrying value method and establishing the AVR charges). The carrying value method is established as described in paragraph 26. ~~Examples of these securities include, but are not limited to equipment trust certificates, credit tenant loans (CTL), 5*/6* securities, interest only (IO) securities, securities with CRP ratings (excluding RMBS/CMBS), loan-backed and structured securities, and mortgage-referenced securities with SVO assigned NAIC designations.~~ [NAIC staff note, it is anticipated that the revisions shown above in this paragraph will be reflected when agenda item 2021-11: SSAP No. 43R – CTL is adopted. As these edits do not impact this agenda item, they are shown here for reference and accordingly, are not shown below in the options presented for possible exposure.]

Specific Interim Reporting Guidance Financially Modeled Securities

28. For securities that will be financially modeled under paragraph 27, the guidance in this paragraph shall be applied in determining the reporting method for such securities acquired in the current year for quarterly financial statements. Securities reported as of the prior-year end shall continue to be reported under the prior-year end methodology for the current-year quarterly financial statements. For year-end reporting, securities shall be reported in accordance with paragraph 27, regardless of the quarterly methodology used.
- a. Reporting entities that acquired the entire financial modeling database for the prior-year end are required to follow the financial modeling methodology (paragraph 27.a.) for all securities acquired in the subsequent year that were included in the financial modeling data acquired for the prior year-end.
 - b. Reporting entities that acquired identical securities (identical CUSIP) to those held and financially modeled for the prior year-end are required to follow the prior year-end financial modeling methodology (paragraph 27.a.) for these securities acquired subsequent to year-end.
 - c. Reporting entities that do not acquire the prior-year financial modeling information for current-year acquired individual CUSIPS, and are not captured within paragraphs 28.a. or 28.b., are required to follow the analytical procedures for non-financially modeled securities (paragraph 27.b. as appropriate). Reporting entities that do acquire the individual CUSIP information from the prior-year financial modeling database shall use that information for interim reporting.
 - d. Reporting entities that acquire securities not previously modeled at the prior year-end are required to follow the analytical procedures for non-financially modeled securities (paragraph 27.b. as appropriate).

SSAP No. 43R - EXHIBIT A – Question and Answer Implementation Guide

Index to Questions

Questions 8-10 are specific to securities subject to the financial modeling process. (This process is limited to qualifying RMBS/CMBS securities reviewed by the NAIC Structured Securities Group.) The guidance in questions 8-10 shall not be inferred to other securities in scope of SSAP No. 43R.	
8	Do LBSS purchased in different lots result in a different NAIC designation for the same CUSIP? Can reporting entities use a weighted average method determined on a legal entity basis?
9	The NAIC Designation process for LBSS may incorporate loss expectations that differ from the reporting entity's expectations related to OTTI conclusions. Should the reporting entities be required to incorporate recovery values obtained from data provided by the service provider used for the NAIC Designation process for impairment analysis as required by SSAP No. 43R?
10	For companies that have separate accounts, can the NAIC designation be assigned based upon the total legal entity or whether it needs to be calculated separately for the general account and the total separate account?

- 8. Question** – Do LBSS purchased in different lots result in a different NAIC designation for the same CUSIP? Can reporting entities use a weighted average method determined on a legal entity basis?
- 8.1 Under the financial modeling process (applicable to qualifying RMBS/CMBS reviewed by the NAIC Structured Securities Group), the amortized cost of the security impacts the “final” NAIC designation used for reporting and RBC purposes. As such, securities subject to the financial modeling process acquired in different lots can result in a different NAIC designation for the same CUSIP. In accordance with the current instructions for calculating AVR and IMR, reporting entities are required to keep track of the different lots separately, which means reporting the different designations. For reporting purposes, if a SSAP No. 43R security (by CUSIP) has different NAIC designations by lot, the reporting entity shall either 1) report the aggregate investment with the lowest applicable NAIC designation or 2) report the investment separately by purchase lot on the investment schedule. If reporting separately, the investment may be aggregated by NAIC designation. (For example, all acquisitions of the identical CUSIP resulting with an NAIC 1 designation may be aggregated, and all acquisitions of the identical CUSIP resulting with an NAIC 3 designation may be aggregated.)
- 9. Question** – The NAIC Designation process for LBSS subject to the financial modeling process may incorporate loss expectations that differ from the reporting entity's expectations related to OTTI conclusions. Should the reporting entities be required to incorporate recovery values obtained from data provided by the service provider used for the NAIC Designation process for impairment analysis as required by SSAP No. 43R?
- 9.1 In accordance with *INT 06-07: Definition of Phrase “Other Than Temporary,”* reporting entities are expected to “consider all available evidence” at their disposal, including the information that can be derived from the NAIC designation.
- 10. Question** - For companies that have separate accounts, can the NAIC designation be assigned based upon the total legal entity or whether it needs to be calculated separately for the general account and the total separate account?
- 10.1 The financial modeling process for qualifying RMBS/CMBS securities is required for applicable securities held in either the general or separate account.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups):

- To be consistent with the P&P Manual revisions, agenda item 2018-19 eliminated the multi-step designation guidance for modified filing exempt (MFE) securities. The elimination of MFE was effective March 31, 2019, with early application permitted for year-end 2018. With the elimination of MFE, for securities that are filing exempt, the NAIC designation reported will correspond to the CRP rating without adjustment based on carrying value. Also, in agenda item 2018-03, the Working Group clarified that securities acquired in lots shall not be reported with weighted average designations. With the adopted guidance, if a SSAP No. 43R security (by CUSIP) has different NAIC designations by lot, the reporting entity shall either 1) report the aggregate investment with the lowest applicable NAIC designation or 2) report the investment separately by purchase lot on the investment schedule. If reporting separately, the investment may be aggregated by NAIC designation. With the elimination of MFE, the instances of different designations by lot is not expected to be prevalent, but could still occur with the financial modeling process for RMBS and CMBS.
- In November 2020, the Working Group adopted edits to SSAP No. 43R from agenda item 2020-21: SSAP No. 43R – Designation Categories for RMBS/CMBS investments, incorporating newly adopted VOSTF guidance to the P&P manual detailing the use and mapping of NAIC designations to NAIC designation categories. Reporting entities were to then utilize the new NAIC designation categories for accounting and reporting purposes.

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group:
None

Convergence with International Financial Reporting Standards (IFRS): Not Applicable

Staff Recommendation: NAIC staff recommends that the Working Group move this item to the active listing, categorized as nonsubstantive and expose revisions to *SSAP No. 43R—Loan-backed and Structured Securities* to reflect the updated financial modeling guidance for RMBS/CMBS securities. These revisions reflect the guidance recently adopted for the *Purposes and Procedures Manual of the NAIC Investment Analysis Office (P&P Manual)*.

NAIC staff note - Two options for incorporating the newly revised P&P manual guidance are presented below. Option 1 retains the past approach to summarize the financial modeling approach. Option 2 removes the summary and instead refers to the P&P Manual. When the modeling guidance was first adopted, it was identified as necessary to summarize in the AP&P. However, as the concept is no longer new, NAIC staff requests feedback on the extent the guidance needs to be retained. Since the P&P Manual governs this process, the AP&P guidance must currently be updated anytime they incorporate a change.

Proposed Revisions to SSAP No. 43R—Loan-Backed and Structured Securities

OPTION #1 – Retain existing guidance in SSAP No. 43R with updates to reflect recent actions of the VOSTF. (If this option is preferred, further updates are likely forthcoming as the VOSTF considers additional modifications to the financial modeling guidance.)

Designation Guidance

27. For RMBS/CMBS securities within the scope of this statement, the initial NAIC designation used to determine the carrying value method and the final NAIC designation for reporting purposes is determined using a multi-step process [or the NAIC designation assigned by the NAIC Securities Valuation Office](#). The P&P Manual provides detailed guidance. A general description of the processes is as follows:

- a. Financial Modeling: Pursuant to the P&P Manual, the NAIC identifies select securities where financial modeling must be used to determine the NAIC designation. For a modeled legacy security, meaning one which closed prior to January 1, 2013, the NAIC designation is based on financial modeling incorporating the insurers' carrying value. For the security a modeled on-legacy security, meaning one which closed after December 31, 2012, the NAIC designation and NAIC designation category assigned by the NAIC Securities Valuation Office must be used. For those legacy securities that are financially modeled, the insurer must use NAIC CUSIP specific modeled breakpoints provided by the modelers in determining initial and final designation for these identified securities. As specified in the P&P Manual, a modeled legacy security RMBS or CMBS tranche that has no expected loss, as compiled and published by the NAIC Securities Valuation Office, under any of the selected modeling scenarios would be assigned an NAIC 1 designation and NAIC 1.A designation category regardless of the insurer's book/adjusted carrying value. ~~securities where modeling results in zero expected loss in all scenarios and that would be equivalent to an NAIC designation and NAIC designation category of NAIC 1 and NAIC 1.A, respectively, if the filing exemption process in the P&P Manual was applied, are automatically considered to have a final NAIC designation of NAIC 1 and NAIC designation category of NAIC 1.A., regardless of the carrying value.~~ The three-step process for modeled legacy securities is as follows:
- i. Step 1: Determine Initial Designation – The current amortized cost (divided by remaining par amount) of a loan-backed or structured security is compared to the modeled breakpoint values assigned to ~~each the six (6)~~ NAIC designations and NAIC designation category for each CUSIP to establish the initial NAIC designation.
 - ii. Step 2: Determine Carrying Value Method – The carrying value method, either the amortized cost method or the lower of amortized cost or fair value method, is then determined as described in paragraph 26 based upon the initial NAIC designation from Step 1.
 - iii. Step 3: Determine Final Designation – The final NAIC designation is determined by comparing the carrying value (divided by remaining par amount) of a security (based on paragraph 27.a.ii.) to the NAIC CUSIP specific modeled breakpoint values assigned to the ~~six (6)~~ NAIC designations and NAIC designation category for each CUSIP ~~or. The final designation~~ is mapped to an NAIC designation category, according to the instructions in the P&P Manual. This final NAIC designation shall be applicable for statutory accounting and reporting purposes and the NAIC designation category will be used for investment schedule reporting and establishing RBC and AVR charges. The final NAIC designation is not used for establishing the appropriate carrying value method in Step 2 (paragraph 27.a.ii.).
- b. All Other Loan-Backed and Structured Securities: For securities not subject to paragraph 27.a. (financial modeling) follow the established designation procedures according to the appropriate section of the P&P Manual. The NAIC designation shall be applicable for statutory accounting and reporting purposes (including determining the carrying value method and establishing the AVR charges). The carrying value method is established as described in paragraph 26.

Specific Interim Reporting Guidance Financially Modeled Securities

28. For securities that will be financially modeled under paragraph 27, the guidance in this paragraph shall be applied in determining the reporting method for such securities acquired in the current year for quarterly financial statements. Securities reported as of the prior-year end shall continue to be reported under the prior-year end methodology for the current-year quarterly financial statements. For year-end reporting, securities shall be reported in accordance with paragraph 27, regardless of the quarterly methodology used.

- a. Reporting entities that acquired the entire financial modeling database for the prior-year end are required to follow the financial modeling methodology (paragraph 27.a.) for all securities acquired in the subsequent year that were included in the financial modeling data acquired for the prior year-end.
- b. Reporting entities that acquired identical securities (identical CUSIP) to those held and financially modeled for the prior year-end are required to follow the prior year-end financial modeling methodology (paragraph 27.a.) for these securities acquired subsequent to year-end.
- c. Reporting entities that do not acquire the prior-year financial modeling information for current-year acquired individual CUSIPS, and are not captured within paragraphs 28.a. or 28.b., are required to follow the analytical procedures for non-financially modeled securities (paragraph 27.b. as appropriate). Reporting entities that do acquire the individual CUSIP information from the prior-year financial modeling database shall use that information for interim reporting.
- d. Reporting entities that acquire securities not previously modeled at the prior year-end are required to follow the analytical procedures for non-financially modeled securities (paragraph 27.b. as appropriate).

OPTION #2 – Remove summarized financial modeling guidance from SSAP No. 43R and refer to the guidance in the P&P Manual. (If this option is preferred, further updates to financial modeling guidance are expected to be isolated to the P&P Manual, which is the governs the designation process.)

Designation Guidance

27. NAIC designations are determined in accordance with the *Purposes and Procedures Manual of the NAIC Investment Analysis Office (P&P Manual)*. The NAIC designations shall be applicable for statutory accounting and reporting purposes (including determining the carrying value and establishing the AVR charges). For RMBS/CMBS securities within the scope of this statement may be subject to the financial modeling process. The P&P Manual shall be consulted for the specific process for obtaining or determining the NAIC designation. ~~the initial NAIC designation used to determine the carrying value method and the final NAIC designation for reporting purposes is determined using a multi-step process. The P&P Manual provides detailed guidance. A general description of the processes is as follows:~~
 - a. ~~Financial Modeling: Pursuant to the P&P Manual, the NAIC identifies select securities where financial modeling must be used to determine the NAIC designation. NAIC designation based on financial modeling incorporates the insurers' carrying value for the security. For those securities that are financially modeled, the insurer must use NAIC CUSIP specific modeled breakpoints provided by the modelers in determining initial and final designation for these identified securities. As specified in the P&P Manual, securities where modeling results in zero expected loss in all scenarios and that would be equivalent to an NAIC designation and NAIC designation category of NAIC 1 and NAIC 1.A., respectively, if the filing exemption process in the P&P Manual was applied, are automatically considered to have a final NAIC designation of NAIC 1 and NAIC designation category of NAIC 1.A., regardless of the carrying value. The three-step process for modeled securities is as follows:~~
 - i. ~~Step 1: Determine Initial Designation—The current amortized cost (divided by remaining par amount) of a loan-backed or structured security is compared to the modeled breakpoint values assigned to the six (6) NAIC designations for each CUSIP to establish the initial NAIC designation.~~
 - ii. ~~Step 2: Determine Carrying Value Method—The carrying value method, either the amortized cost method or the lower of amortized cost or fair value method, is then determined as described in paragraph 26 based upon the initial NAIC designation from Step 1.~~

- iii. ~~Step 3: Determine Final Designation—The final NAIC designation is determined by comparing the carrying value (divided by remaining par amount) of a security (based on paragraph 27.a.ii.) to the NAIC CUSIP specific modeled breakpoint values assigned to the six (6) NAIC designations for each CUSIP. The final designation is mapped to an NAIC designation category according to the instructions in the P&P Manual. This final NAIC designation shall be applicable for statutory accounting and reporting purposes and the NAIC designation category will be used for investment schedule reporting and establishing RBC and AVR charges. The final NAIC designation is not used for establishing the appropriate carrying value method in Step 2 (paragraph 27.a.ii.).~~
- b. ~~All Other Loan-Backed and Structured Securities: For securities not subject to paragraph 27.a. (financial modeling) follow the established designation procedures according to the appropriate section of the P&P Manual. The NAIC designation shall be applicable for statutory accounting and reporting purposes (including determining the carrying value method and establishing the AVR charges). The carrying value method is established as described in paragraph 26.~~

Specific Interim Reporting Guidance Financially Modeled Securities

- 27. ~~For securities that will be financially modeled under paragraph 27, the guidance in this paragraph shall be applied in determining the reporting method for such securities acquired in the current year for quarterly financial statements. Securities reported as of the prior year end shall continue to be reported under the prior year end methodology for the current year quarterly financial statements. For year-end reporting, securities shall be reported in accordance with paragraph 27, regardless of the quarterly methodology used.~~
 - a. ~~Reporting entities that acquired the entire financial modeling database for the prior year end are required to follow the financial modeling methodology (paragraph 27.a.) for all securities acquired in the subsequent year that were included in the financial modeling data acquired for the prior year end.~~
 - b. ~~Reporting entities that acquired identical securities (identical CUSIP) to those held and financially modeled for the prior year end are required to follow the prior year end financial modeling methodology (paragraph 27.a.) for these securities acquired subsequent to year-end.~~
 - c. ~~Reporting entities that do not acquire the prior year financial modeling information for current year acquired individual CUSIPS, and are not captured within paragraphs 28.a. or 28.b., are required to follow the analytical procedures for non-financially modeled securities (paragraph 27.b. as appropriate). Reporting entities that do acquire the individual CUSIP information from the prior year financial modeling database shall use that information for interim reporting.~~
 - d. ~~Reporting entities that acquire securities not previously modeled at the prior year end are required to follow the analytical procedures for non-financially modeled securities (paragraph 27.b. as appropriate).~~

Staff Review Completed by: Jim Pinegar, NAIC Staff – October 2021

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this agenda item to the active listing, categorized as nonsubstantive, and exposed two options for possible revision, as illustrated above, to update the summarized financial modeling guidance in SSAP No. 43R. The first option will retain existing guidance, with updates to reflect Valuation of Securities (E) Task Force adopted edits. The second option removes the summarized financial modeling guidance and refers users to the *Purposes and Procedures Manual of the NAIC Investment Analysis Office*, which is the source document for financial modeling guidance.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted, as final, the exposed revisions (Option #2), as illustrated below, retaining, but updating summarized financial modeling guidance for residential mortgage-backed securities and commercial mortgage-backed securities in *SSAP No. 43R—Loan-Backed and Structured Securities*. This guidance continues to refer users to the detailed financial modeling guidance in the *Purposes and Procedures Manual of the Investment Analysis Office*. The revisions incorporate a minor grammatical edit as proposed by interested parties.

Designation Guidance

27. For RMBS/CMBS securities within the scope of this statement, the initial NAIC designation used to determine the carrying value method and the final NAIC designation for reporting purposes is determined using a multi-step process [or the NAIC designation assigned by the NAIC Securities Valuation Office](#). The P&P Manual provides detailed guidance. A general description of the processes is as follows:
- a. Financial Modeling: Pursuant to the P&P Manual, the NAIC identifies select securities where financial modeling must be used to determine the NAIC designation. [For a modeled legacy security, meaning one which closed prior to January 1, 2013, the NAIC designation is based on financial modeling incorporating the insurer's carrying value. For the security, a modeled non-legacy security, meaning one which closed after December 31, 2012, the NAIC designation and NAIC designation category assigned by the NAIC Securities Valuation Office must be used.](#) For those [legacy](#) securities that are financially modeled, the insurer must use NAIC CUSIP specific modeled breakpoints provided by the modelers in determining initial and final designation for these identified securities. As specified in the P&P Manual, [a modeled legacy security RMBS or CMBS tranche that has no expected loss, as compiled and published by the NAIC Securities Valuation Office, under any of the selected modeling scenarios would be assigned an NAIC 1 designation and NAIC 1.A designation category regardless of the insurer's book/adjusted carrying value. securities where modeling results in zero expected loss in all scenarios and that would be equivalent to an NAIC designation and NAIC designation category of NAIC 1 and NAIC 1.A, respectively, if the filing exemption process in the P&P Manual was applied, are automatically considered to have a final NAIC designation of NAIC 1 and NAIC designation category of NAIC 1.A, regardless of the carrying value.](#) The three-step process for modeled [legacy](#) securities is as follows:
 - i. Step 1: Determine Initial Designation – The current amortized cost (divided by remaining par amount) of a loan-backed or structured security is compared to the modeled breakpoint values assigned to ~~each the six (6)~~ NAIC designations [and NAIC designation category](#) for each CUSIP to establish the initial NAIC designation.
 - ii. Step 2: Determine Carrying Value Method – The carrying value method, either the amortized cost method or the lower of amortized cost or fair value method, is then determined ~~as~~ described in paragraph 26 based upon the initial NAIC designation from Step 1.
 - iii. Step 3: Determine Final Designation – The final NAIC designation is determined by comparing the carrying value (divided by remaining par amount) of a security (based on paragraph 27.a.ii.) to the NAIC CUSIP specific modeled breakpoint values assigned to the ~~six (6)~~ NAIC designations [and NAIC designation category](#) for each CUSIP ~~or~~ ~~The final designation~~ is mapped to an NAIC designation category, according to the instructions in the P&P Manual. This final NAIC designation shall be applicable for statutory accounting and reporting purposes and the NAIC designation category will be used for investment schedule reporting and establishing RBC and AVR charges. The final NAIC designation is not used for establishing the appropriate carrying value method in Step 2 (paragraph 27.a.ii.).

- b. All Other Loan-Backed and Structured Securities: For securities not subject to paragraph 27.a. (financial modeling) follow the established designation procedures according to the appropriate section of the P&P Manual. The NAIC designation shall be applicable for statutory accounting and reporting purposes (including determining the carrying value method and establishing the AVR charges). The carrying value method is established as described in paragraph 26.

**Statutory Accounting Principles (E) Working Group
Maintenance Agenda Submission Form
Form A**

Issue: General Interrogatory for Cryptocurrencies

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue: On May 20, 2021, the Statutory Accounting Principles (E) Working Group adopted *INT 21-01: Accounting for Cryptocurrencies*, which addressed the statutory accounting treatment for cryptocurrencies, and established that directly held cryptocurrencies do not meet the definition of an admitted asset for statutory accounting. While researching this topic, it was noted that some insurance companies held cryptocurrencies, but that these were not always easy to identify in the statutory financial statements. Additionally, as the use of cryptocurrencies by insurance companies evolves, regulators expressed a desire to better understand how companies are using cryptocurrencies. NAIC staff were directed by the Working Group to look at possible ways to get a better view of how cryptocurrencies are currently directly held and used by insurance companies.

NAIC staff have proposed a new general interrogatory within the annual reporting blanks with several questions specific to cryptocurrencies. This is proposed as a new general interrogatory as this is information that has not been previously disclosed and does not fit well with any existing disclosures.

There are no proposed changes to statutory accounting, however the agenda item does result in a sponsored blanks proposal to the Blanks (E) Working Group to incorporate the general interrogatory and related instructions. NAIC staff from the Statutory Accounting Principles (E) Working Group will work directly with the Blanks (E) Working Group staff support.

Existing Authoritative Literature: As articulated in the “description of issue” section, INT 21-01 established that directly held cryptocurrencies do not meet the definition of an admitted asset and are therefore nonadmitted for statutory accounting.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups): INT 21-01, discussed in the prior section.

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group:
None

Convergence with International Financial Reporting Standards (IFRS): The IFRS Interpretations Committee issued a statement in June 2019 concluding that cryptocurrencies are not financial assets, however that they do meet the definition of an intangible asset.

Staff Recommendation:

NAIC staff recommends that the Working Group forward a sponsored blanks proposal to the Blanks (E) Working Group to add a new general interrogatory to the annual statement blanks to capture information about cryptocurrencies directly held or permitted for the remittance of premiums. Note, this agenda item does not propose statutory revisions. The proposed additions to the reporting blanks and the blanks instructions are shown below.

Annual Statement Instructions, General Interrogatories, Investment Section: (All Types):

38.1 Answer "YES" if the company directly owns cryptocurrencies. Answer "NO" if the company does not directly own cryptocurrencies or only holds cryptocurrencies indirectly through funds (ETFs, Mutual Funds, etc.) INT 21-01: Accounting for Cryptocurrencies established that directly held cryptocurrencies do not meet the definition of cash or an admitted asset and are therefore considered to be a nonadmitted asset for statutory accounting.

38.2 If the answer to 38.1 is "YES", specify on which schedule they are reported. (e.g., Schedule BA, etc.)

39.2 If the answer to 39.1 is "YES", indicate if it is the policy of the reporting entity to directly hold cryptocurrency accepted as payment for premiums or immediately convert to U.S. dollars. Select "YES" for both questions if some cryptocurrencies are held directly and others are immediately converted to U.S. dollars.

39.21 Answer "YES" if it is the policy of the reporting entity to directly hold cryptocurrency that was accepted as payment for premiums.

39.22 Answer "YES" if it is the policy of the reporting entity to immediately convert cryptocurrency accepted as payment for premiums to U.S. dollars.

39.3 If the answer to 38.1 or 39.1 is "YES", complete Columns 1 through 3 for each cryptocurrency accepted for payments of premiums or held directly.

Name of Cryptocurrency:

Provide the name of each cryptocurrency accepted for payments of premiums or held directly.

Immediately Converted to USD, Directly Held, or Both:

For each cryptocurrency listed, provide one of the following responses:

- Immediately converted to USD
- Directly held.
- Both.

Accepted for Payment of Premiums:

If the cryptocurrencies are accepted for the payment of premiums provide the response of "YES" in the column otherwise the response in the column should be "NO".

Annual Statement Blanks, General Interrogatories, Investment Section: (All Types):

38.1 Does the reporting entity directly hold cryptocurrencies? Yes No

38.2 If the response to 38.1 is yes, on what schedule are they reported?

39.1 Does the reporting entity directly or indirectly accept cryptocurrencies as payment for premiums on policies? Yes No

39.2 If the response to 39.1 is yes, are the cryptocurrencies held directly or are they immediately converted to U.S. dollars?

39.21 Hold directly Yes No

39.22 Immediately converted to U.S. dollars Yes No

39.3 If the response to 38.1 or 39.1 is yes, list all cryptocurrencies accepted for payments of premiums or that are held directly.

<u>1</u>	<u>2</u>	<u>3</u>
<u>Name of Cryptocurrency</u>	<u>Immediately Converted to USD, Directly Held, or Both</u>	<u>Accepted for Payment of Premiums</u>

Staff Review Completed by: Jake Stultz, NAIC Staff, November 2021**Status:**

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this item to the active listing and exposed proposed revisions to be incorporated into a Blanks (E) Working Group proposal to add a new general interrogatory to the annual blanks, requiring disclosure of when cryptocurrencies are directly held or permitted for the remittance of premiums. This agenda item did not propose statutory revisions.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted this agenda item, which did not result in statutory accounting revisions, however adoption expressed support of the corresponding Blanks (E) Working Group proposal (2022-01BWG), which incorporates a new general interrogatory to detail if cryptocurrencies are directly held or permitted for the remittance of premiums.

NAIC Accounting Practices and Procedures Manual
Editorial and Maintenance Update
December 11, 2021

Maintenance updates provide revisions to the *Accounting Practices and Procedures Manual* (AP&P Manual), such as editorial corrections, reference changes and formatting.

SSAP/Appendix	Description/Revision
Various	<p>Pursuant to an Aug. 14 referral from the Financial Condition (E) Committee, the edits proposed herein update the terminology references of “substantive” and “nonsubstantive,” which have historically been used to describe statutory accounting revisions being considered by the Statutory Accounting Principles (E) Working Group to the AP&P Manual.</p> <p>The Committee recommended terminology updates to alleviate concerns that users who are not familiar with the historical definitions of the aforementioned terms may incorrectly perceive that the terms reflect potential financial impact rather than their intended definitions. Accordingly, where applicable, the current concept/term of:</p> <ol style="list-style-type: none"> 1) a “substantive” revision is proposed to be replaced with the phraseology of a “New SAP or New SAP concept in an existing SSAP,” and, 2) a “nonsubstantive” revision is proposed to be replaced with the phraseology of a “SAP clarification.” <p>Agenda item 2021-14: SAP Terminology, which was previously exposed by the Working Group on Aug. 26, addresses the proposed terminology/phraseology changes in the <i>NAIC Policy Statement on Maintenance of Statutory Accounting Principles</i> (Appendix F). This editorial agenda item identifies all remaining uses of the terms in the current AP&P manual for change consideration.</p> <p>Please note, it is anticipated that terminology changes will generally only occur on a <u>go-forward basis</u> as amendments to previously adopted SSAPs, issue papers, agenda items or other historical documents will not occur. As such, the terms used in previously adopted guidance will remain, with the new terms being used prospectively when considering future revisions to statutory accounting.</p>

Recommendation:

NAIC staff recommend that the Statutory Accounting Principles (E) Working Group move this agenda item to the active listing, categorize as nonsubstantive, and expose editorial revisions as illustrated below.

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this item to the active listing, categorized as nonsubstantive, and exposed revisions to certain, remaining terminology references of “substantive” and “nonsubstantive,” as illustrated below.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted, as final, the exposed editorial revisions as shown below.

Various SSAPs in response to terminology changes of “Substantive” and “Nonsubstantive”**Edit 1: Table of Contents (How to use this Manual), Volume I, Page xvii****Summary of Changes:**

The Summary of Changes outlines changes made to the prior edition of the Manual to create the current year’s version. It is divided into three sections: 1) [the development of new SSAPs or new SAP concepts to existing SSAPs](#)~~substantive revisions to statutory accounting principles~~; 2) [SAP clarifications](#)~~nonsubstantive revisions to statutory accounting principles~~; and 3) revisions to the appendices included in the Manual. The Summary of Changes is a key resource for readers who are looking to identify changes from the prior edition.

Edit 2: Table of Contents (How to use this Manual), Volume I, Page xviii**Statements of Statutory Accounting Principles:**

As indicated by the Statutory Hierarchy, the Statements of Statutory Accounting Principles (SSAPs) are the primary authoritative statutory accounting practices and procedures promulgated by the NAIC. These statements are the result of issue papers that have been exposed for public comment and finalized. Finalized issue papers are found in Appendix E and ARE NOT authoritative. While it is not intended that there be any significant differences between an underlying issue paper and the resultant SSAP, if differences exist, the SSAP prevails and shall be considered definitive. Readers may use the NAIC website to keep abreast of [adopted revisions](#)~~substantive and nonsubstantive changes~~ to the SSAPs. Completely superseded SSAPs that are no longer authoritative are moved from the printed Manual into *Appendix H – Superseded SSAPs and Nullified Interpretations*, which is posted for public reference on the Statutory Accounting Principles (E) Working Group web page at https://content.naic.org/cmte_e_app_sapwg.htm.

Edit 3: Table of Contents (How to use this Manual), Volume I, Page xviii**New paragraph proposed (To be inserted between the paragraphs starting with “As indicated by the Statutory Hierarchy...” and “The cover page of each SSAP...”**

[Prior to \(adoption date\), the term used to describe a new SAP concept or a new SAP concept in an existing SSAP was “substantive” and the term used to describe a SAP clarification was “nonsubstantive.” The new terms will be reflected in materials to describe revisions to statutory accounting principles on a prospective basis and historical documents will not be updated to reflect the revised terms.](#)

Edit 4: Table of Contents (How to use this Manual), Volume I, Page xviii

AFFECTS/AFFECTED BY – A useful tool for tracking relationships between statements and interpretations is contained within these sections. The “affects” section is used when a SSAP [has previously been](#)~~substantively amends-amended to reflect new SAP concepts or superseded by other~~ ~~or supersedes previously~~ issued SSAPs. Nullified INTs are also noted in this section. Readers are referenced to another SSAP in the “affected by” section if the SSAP has been ~~substantively amended or~~ superseded [or amended with a new SAP concept or with the issuance of a new SSAP](#). Text within paragraphs ~~substantively~~ amended [with new SAP concepts](#) or superseded may also be “shaded” to notify readers that revised guidance is available.

Edit 5: Table of Contents (How to use this Manual), Volume I, Page xviii

Refer to the Relevant Literature and Effective Date and Transition sections of each SSAP for details of [the development of new SSAPs or new SAP concepts, as well as changes as the result of SAP clarifications](#)~~substantive and nonsubstantive changes~~.

Edit 6: Summary of Changes, Volume I, Page xxiii

Section 1 summarizes ~~substantive~~ revisions [that result with a new SSAP or new SAP concept](#) to statutory accounting principles. ~~Substantive R~~revisions [that](#) introduce original or modified accounting principles and can be reflected in an existing or new SSAP. When ~~substantive~~ revisions [that result in a new SAP concept](#) are made to an existing SSAP, the effective date is identified in the Status section, and the revised text within is depicted by underlines (new language) and strikethroughs (removed language). This tracking will not be shown in subsequent manuals. New [SSAPs and new SAP concepts that revise existing](#) ~~substantively revised~~ SSAPs are

commonly accompanied by a corresponding issue paper that reflects the revisions for historical purposes. If language in an existing SSAP is superseded, that language is shaded and the new or substantively revised SSAP is referenced. Completely superseded SSAPs and nullified interpretations are included in Appendix H.

Edit 7: Summary of Changes, Volume I, Page xxiii

Section 2 summarizes ~~the nonsubstantive~~ revisions that clarify existing ~~to~~ statutory accounting principles. ~~Nonsubstantive~~ These revisions are characterized as language clarifications which do not modify the original intent of a SSAP, or changes to reference material. ~~Nonsubstantive~~ Such revisions are depicted by underlines (new language) and strikethroughs (removed language) and will not be tracked in subsequent manuals. ~~Nonsubstantive~~ Rvisions that clarify existing statutory accounting principles are effective when adopted unless a specific effective date is noted.

Edit 8: Summary of Changes (heading in table), Volume I, Page xxiii

1. ~~Substantive~~ Revisions that resulted in a new SSAP or a new SAP concept – Statutory Accounting Principles

Edit 9: Summary of Changes (heading in table), Volume I, Page xxiii

2. ~~Nonsubstantive~~ Revisions that resulted in a SAP clarification – Statutory Accounting Principles

Edit 10: Preamble, Volume I, Page P-5

23. The Accounting Practices and Procedures (E) Task Force will accomplish its mission through charges assigned to the following working groups:

- Statutory Accounting Principles (E) Working Group: Responsible for developing and adopting ~~substantive and nonsubstantive~~ revisions to the Statements of Statutory Accounting Principles (SSAPs). Statutory accounting principles provide the basis for insurers to prepare financial statements for financial regulation purposes, and SSAPs are considered level 1 (highest authority) in the statutory accounting hierarchy. Refer to the Statutory Accounting Principles (E) Working Group Web page (http://www.naic.org/cmte_e_app_sapwg.htm) for specific information and charges.
- Blanks (E) Working Group: Considers improvements and revisions to various annual/quarterly statement blanks to conform to changes made in other areas of the NAIC to promote uniformity in reporting of financial information by insurers and develop reporting formats for other entities subject to the jurisdiction of state insurance departments. Refer to the Blanks (E) Working Group webpage (http://www.naic.org/cmte_e_app_blanks.htm) for specific information and charges.

Edit 11: Preamble, Volume I, Page P-9

47. Once promulgated, statements will only be amended or superseded through the issuance of new SSAP pronouncements. If it is necessary to introduce a new SAP concept that will ~~substantially~~ modify or augment the guidance in an existing SSAP, a new statement will be promulgated and/or the statement will be reissued with “revised” in the title. ~~Non-substantial~~ Changes as a result of clarifying an existing SAP will be included in the existing statement with changes tracked (i.e., new text will be underlined and deleted text as strikethrough) in the next printing of the Manual. Then no changes will be shown after the initial year. A useful tool for tracking of the relationships between statements is contained in the “Status” section of each statement which includes sections labeled “Affects” and “Affected By.” As SSAPs are issued in the future that modify or augment the guidance previously provided, these sections will identify the relationships between statements.

Edit 12: Table of Contents (How to use this Manual), Volume II, Page xvii

Summary of Changes:

The Summary of Changes outlines changes made to the prior edition of the Manual to create the current year’s version. It is divided into three sections: 1) the development of new SSAPs or new SAP concepts to existing SSAPs ~~substantive revisions to statutory accounting principles~~; 2) SAP clarifications ~~nonsubstantive revisions to statutory accounting principles~~; and 3) revisions to the appendices included in the Manual. The Summary of Changes is a key resource for readers who are looking to identify changes from the prior edition.

Edit 13: Table of Contents (How to use this Manual), Volume II, Page xviii***Statements of Statutory Accounting Principles:***

As indicated by the Statutory Hierarchy, the Statements of Statutory Accounting Principles (SSAPs) are the primary authoritative statutory accounting practices and procedures promulgated by the NAIC. These statements are the result of issue papers that have been exposed for public comment and finalized. Finalized issue papers are found in Appendix E and ARE NOT authoritative. While it is not intended that there be any significant differences between an underlying issue paper and the resultant SSAP, if differences exist, the SSAP prevails and shall be considered definitive. Readers may use the NAIC website to keep abreast of [adopted revisions](#) ~~substantive and nonsubstantive changes~~ to the SSAPs. Completely superseded SSAPs that are no longer authoritative are moved from the printed Manual into *Appendix H – Superseded SSAPs and Nullified Interpretations*, which is posted for public reference on the Statutory Accounting Principles (E) Working Group web page at https://content.naic.org/cmte_e_app_sapwg.htm.

Edit 14: Table of Contents (How to use this Manual), Volume II, Page xviii

New paragraph proposed (To be inserted between the paragraphs starting with "As indicated by the Statutory Hierarchy..." and "The cover page of each SSAP...")

[Prior to \(adoption date\), the term used to describe a new SAP concept or a new SAP concept in an existing SSAP was "substantive" and the term used to describe a SAP clarification was "nonsubstantive." The new terms will be reflected in materials to describe revisions to statutory accounting principles on a prospective basis and historical documents will not be updated to reflect the revised terms.](#)

Edit 17: Summary of Changes, Volume II, Page xxiii

Section 1 summarizes ~~substantive~~ revisions [that result with a new SSAP or new SAP concept](#) to statutory accounting principles. ~~Substantive~~ **R**evisions [that](#) introduce original or modified accounting principles and can be reflected in an existing or new SSAP. When ~~substantive~~ revisions [that result in a new SAP concept](#) are made to an existing SSAP, the effective date is identified in the Status section, and the revised text within is depicted by underlines (new language) and strikethroughs (removed language). This tracking will not be shown in subsequent manuals. New **SSAPs** and [new SAP concepts that revise existing](#) ~~substantively revised~~ SSAPs are commonly accompanied by a corresponding issue paper that reflects the revisions for historical purposes. If language in an existing SSAP is superseded, that language is shaded and the new or substantively revised SSAP is referenced. Completely superseded SSAPs and nullified interpretations are included in Appendix H.

Edit 18: Summary of Changes, Volume II, Page xxiii

Section 2 summarizes ~~the nonsubstantive~~ revisions [that clarify existing](#) ~~to~~ statutory accounting principles. ~~Nonsubstantive~~ **T**hese revisions are characterized as language clarifications which do not modify the original intent of a SSAP, or changes to reference material. ~~Nonsubstantive~~ **S**uch revisions are depicted by underlines (new language) and strikethroughs (removed language) and will not be tracked in subsequent manuals. ~~Nonsubstantive~~ **R**evisions [that clarify existing statutory accounting principles](#) are effective when adopted unless a specific effective date is noted.

Edit 19: Summary of Changes (heading in table), Volume II, Page xxiii

1. ~~Substantive~~ Revisions [that resulted in a new SSAP or a new SAP concept](#) – Statutory Accounting Principles

Edit 20: Summary of Changes (heading in table), Volume II, Page xxiii

2. ~~Nonsubstantive~~ Revisions [that resulted in a SAP clarification](#) – Statutory Accounting Principles

Edit 21: Appendix F: NAIC Policy Statement of Statutory Accounting Principles Maintenance Agenda Process, Volume II, Page F-5

3. Information and issues can be presented to the Working Group in a variety of ways. Issues can be recommended or forwarded from 1) other NAIC committees, task forces or working groups; 2) interested parties; 3) interested regulators; and 4) NAIC staff. Also, if any guidance within the Generally Accepted Accounting Principles (GAAP) Hierarchy (see § V of the Preamble to the *Accounting Practices and Procedures Manual* (AP&P Manual)) is added or revised, those changes must be considered by the Working Group for potential revisions to SAP. In order for an issue to be placed on the **Pending Listing**, the recommending party must complete a Statutory Accounting Principles Maintenance Agenda Submission Form (Form A) and submit it to the Working Group support staff no later than 20 business days prior to the next scheduled Working Group meeting. NAIC staff will prepare a submission form for all GAAP pronouncements that have not been previously addressed by the Working Group. NAIC staff will update the **Pending Listing** before each national meeting and will notify the recommending party of such action. If the Working Group does not wish to address the issue (e.g., issue deemed not applicable to statutory accounting) or rejects the position presented, then the Working Group may move the item to the **Rejected Listing**. Should the Working Group choose to address an issue, it is moved to the **Active Listing** where it is prioritized and categorized as a [new SSAP concept, clarification of an existing SSAP](#), ~~Substantive, Nonsubstantive~~ or [an Interpretation](#) agenda item.

Edit 22: Appendix F: NAIC Policy Statement of Statutory Accounting Principles Maintenance Agenda Process, Volume II, Page F-5

4. The **Active Listing** identifies agenda items that are in the process of development and includes the following:
 - a. **New SAP ConceptSubstantive**: These agenda items address the development of new SSAPs ~~and/or the introduction of a new~~ ~~and substantially revised~~ ~~SSAPs~~ [concept](#) as defined in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*.
 - b. **Clarification of an Existing SSAPNonsubstantive**: These agenda items address the development of ~~nonsubstantive~~-revisions [which clarify an existing](#) ~~to~~ SAP as defined in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*.
 - c. **Interpretations**: These agenda items address the development of interpretations to SAP as defined in the NAIC *Policy Statement on Maintenance of Statutory Accounting Principles*. If SSAP revisions are subsequently deemed necessary, the Working Group shall re-categorize the agenda item as either [a New SAP concept, or a clarification of an existing SSAP](#) ~~substantive or nonsubstantive~~, as applicable, and follow the appropriate process to consider and adopt revisions.

Edit 23: Appendix F: NAIC Policy Statement of Statutory Accounting Principles Maintenance Agenda Process, Volume II, Page F-5

5. After review of the agenda item (including any interested party comments), at its discretion, the Working Group makes the ultimate determination of whether an agenda item is categorized (or re-categorized) as [a new SAP concept, clarification of an existing SSAP](#) ~~substantive (either as a new SSAP or substantively revised SSAP)~~, ~~nonsubstantive~~ or an interpretation.

Edit 24: Appendix F: NAIC Policy Statement of Statutory Accounting Principles Maintenance Agenda Process, Volume II, Page F-6

8. NAIC staff will maintain the following on the Working Group Web page (http://naic.org/cmte_e_app_sapwg.htm): 1) A blank Form A (Attachment A to this policy statement); 2) The current Maintenance Agenda, and 3) Current ~~statutory substantive, nonsubstantive~~ and/or interpretation revisions exposed for public comment. Attachment B to this policy statement will be attached to all exposures with proposed ~~substantive~~-revisions [that result in a new SAP concept](#) and serves as the request for written comment and notice of a public hearing.

**Statutory Accounting Principles (E) Working Group
Maintenance Agenda Submission Form
Form A**

Issue: ASU 2021-04 - *Issuer's Accounting for Certain Modifications or Exchanges of Freestanding Equity-Classified Written Call Options*

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue: In May 2021, the Financial Accounting Standards Board (FASB) issued *Accounting Standard Update (ASU) 2021-04, Earnings Per Share (Topic 260), Debt—Modifications and Extinguishments (Subtopic 470-50), Compensation—Stock Compensation (Topic 718), and Derivatives and Hedging—Contracts in Entity's Own Equity (Subtopic 815-40)—Issuer's Accounting for Certain Modifications or Exchanges of Freestanding Equity-Classified Written Call Options*. The amendments in this ASU impact all entities that issue freestanding written call options, that are then modified in connection with either an equity issuance, debt origination or a debt modification.

The amendments affect those entities for when a freestanding equity-classified written call option is modified, or exchanged, and the instrument remains classified as equity after the modification or exchange. This topic is discussed in *SSAP No. 72—Surplus and Quasi-Reorganization*, paragraph 10. If the warrant is modified as part of a debt modification and the warrant is held by the creditor involved in the debt modification, the issuer would treat the warrant's change in value as a fee to or from the creditor, based on if it is an increase or a decrease. If the modification of the warrant is connected to a debt modification where the debt is held by a third-party, the increase in fair-value of the warrant will be treated as third-party cost, and any decreases would be disregarded. Guidance for debt issuance costs is in *SSAP No. 15—Debt and Holding Company Obligations*.

The main provisions of this ASU are:

1. An entity should treat a modification of the terms or conditions or an exchange of a freestanding equity-classified written call option that remains equity classified after modification or exchange as an exchange of the original instrument for a new instrument.
2. An entity should measure the effect of a modification or an exchange of a freestanding equity-classified written call option that remains equity classified after modification or exchange as follows:
 - a. For a modification or an exchange that is a part of or directly related to a modification or an exchange of an existing debt instrument or line-of-credit or revolving-debt arrangements (hereinafter, referred to as a "debt" or "debt instrument"), as the difference between the fair value of the modified or exchanged written call option and the fair value of that written call option immediately before it is modified or exchanged.
 - b. For all other modifications or exchanges, as the excess, if any, of the fair value of the modified or exchanged written call option over the fair value of that written call option immediately before it is modified or exchanged.
3. An entity should recognize the effect of a modification or an exchange of a freestanding equity-classified written call option that remains equity classified after modification or exchange on the basis of the substance of the transaction.

An entity should recognize the effect of a modification or an exchange of a freestanding equity-classified written call option to compensate for goods or services in accordance with the guidance in Topic 718, Compensation—Stock Compensation. In a multiple-element transaction (for example, one that includes both debt financing and equity financing), the total effect of the modification should be allocated to the respective elements in the transaction.

Existing Authoritative Literature: The guidance for the issuance of stock purchase warrants is in *SSAP No. 72—Surplus and Quasi-Reorganization*, paragraph 10, and guidance for debt issuance costs is included in *SSAP No. 15—Debt and Holding Company Obligations*, paragraph 5.

SSAP No. 72:

10. Stock purchase warrants issued in return for cash shall be credited to gross paid-in and contributed surplus. When debt instruments are issued with conversion features, no value shall be assigned to the conversion features unless the conversion feature is clearly separable from the debt obligation in the form of a detachable stock purchase warrant. In such instances the relative fair value of the detachable stock purchase warrant at time of issue shall be credited to gross paid-in and contributed surplus. For instances in which a reporting entity has issued puttable warrants or mandatorily redeemable warrants, such items shall be reflected as liabilities as the warrants obligate the reporting entity to ultimately transfer cash or other assets to the holder in order to repurchase the shares.

SSAP No. 15:

5. Debt issuance costs (e.g., loan fees and legal fees) do not meet the definition of an asset as defined in SSAP No. 4—Assets and Nonadmitted Assets. Accordingly, these costs shall be charged to operations in the period incurred.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups): None

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group: None

Convergence with International Financial Reporting Standards (IFRS): None.

Staff Review Completed by: Jake Stultz -NAIC staff, September 2021

Staff Recommendation:

NAIC staff recommends that the Working Group move this item to the active listing and expose revisions to *SSAP No. 72—Surplus and Quasi-Reorganization* to reject ASU 2021-04 for statutory accounting. However, NAIC staff recommends that the FASB guidance related to accounting for the changes in fair value regarding the exchange of a free-standing equity-classified written call option be incorporated into SSAP No. 72.

Proposed revisions to SSAP No. 72:

10. Stock purchase warrants issued in return for cash shall be credited to gross paid-in and contributed surplus. An entity shall treat a modification of the terms or conditions or an exchange of a freestanding equity-classified written call option as an exchange of the original instrument for a new instrument. In substance, the entity repurchases the original instrument by issuing a new instrument. The total effect of the modification or exchange shall be allocated to the respective elements in the transaction. When debt instruments are issued with conversion features, no value shall be assigned to the conversion features unless the conversion feature is clearly separable from the debt obligation in the form of a detachable stock purchase warrant. In such instances the relative fair value of the detachable stock purchase warrant at time of issue shall be credited to gross paid-in and contributed surplus. For instances in which a reporting entity has issued puttable warrants or mandatorily redeemable warrants, such items shall be reflected as liabilities

as the warrants obligate the reporting entity to ultimately transfer cash or other assets to the holder in order to repurchase the shares.

29. This statement also rejects *Accounting Research Bulletin No. 43, Restatement and Revision of Accounting Research Bulletins*, “Chapter 1, Prior Opinions,” paragraph 12 of APB 10, and *FASB Technical Bulletin No. 85-6, Accounting for a Purchase of Treasury Shares at a Price Significantly in Excess of the Current Market Price of the Shares and the Income Statement Classification of Costs Incurred in Defending against a Takeover Attempt and Accounting Standard Update (ASU) 2021-04, Earnings Per Share (Topic 260), Debt—Modifications and Extinguishments (Subtopic 470-50), Compensation—Stock Compensation (Topic 718), and Derivatives and Hedging—Contracts in Entity’s Own Equity (Subtopic 815-40)—Issuer’s Accounting for Certain Modifications or Exchanges of Freestanding Equity-Classified Written Call Options*.

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this agenda item to the active listing, categorized as nonsubstantive, and exposed revisions, as illustrated above, to incorporate guidance related to the accounting for the changes in fair value when exchanging equity-classified written call options, while rejecting the remainder of ASU 2021-04 in SSAP No. 72.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted SAP clarifications to *SSAP No. 72—Surplus and Quasi-Reorganizations* to reject ASU 2021-04 for statutory accounting while incorporating guidance that modifications of terms, conditions or exchanges of free-standing equity-classified written call options shall be treated as an exchange, as detailed below. The adopted revisions included additional changes to the exposed language in paragraph 29, which interested parties requested.

10. Stock purchase warrants issued in return for cash shall be credited to gross paid-in and contributed surplus. An entity shall treat a modification of the terms or conditions or an exchange of a freestanding equity-classified written call option as an exchange of the original instrument for a new instrument. In substance, the entity repurchases the original instrument by issuing a new instrument. The total effect of the modification or exchange shall be allocated to the respective elements in the transaction. When debt instruments are issued with conversion features, no value shall be assigned to the conversion features unless the conversion feature is clearly separable from the debt obligation in the form of a detachable stock purchase warrant. In such instances the relative fair value of the detachable stock purchase warrant at time of issue shall be credited to gross paid-in and contributed surplus. For instances in which a reporting entity has issued puttable warrants or mandatorily redeemable warrants, such items shall be reflected as liabilities as the warrants obligate the reporting entity to ultimately transfer cash or other assets to the holder in order to repurchase the shares.

29. This statement also rejects *Accounting Research Bulletin No. 43, Restatement and Revision of Accounting Research Bulletins*, “Chapter 1, Prior Opinions,” paragraph 12 of APB 10, and *FASB Technical Bulletin No. 85-6, Accounting for a Purchase of Treasury Shares at a Price Significantly in Excess of the Current Market Price of the Shares and the Income Statement Classification of Costs Incurred in Defending against a Takeover Attempt and Accounting Standard Update (ASU) 2021-04, Earnings Per Share (Topic 260), Debt—Modifications and Extinguishments (Subtopic 470-50), Compensation—Stock Compensation (Topic 718), and Derivatives and Hedging—Contracts in Entity’s Own Equity (Subtopic 815-40)—Issuer’s Accounting for Certain Modifications or Exchanges of Freestanding Equity-Classified Written Call Options*, while incorporating guidance that clarifies that an entity shall treat a modification of the terms or conditions or an exchange of a freestanding equity-classified written call option as an exchange of the original instrument for a new instrument.

Issue: *ASU 2021-03, Intangibles – Goodwill and Other (Topic 350) – Accounting Alternative for Evaluating Triggering Events*

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue:

In March 2021, the Financial Accounting Standards Board (FASB) issued Accounting Standard Update (ASU) 2021-03, *Intangibles – Goodwill and Other – Accounting Alternative for Evaluating Triggering Events* to provide private companies and not-for-profit entities with an optional accounting alternative for the performance of a goodwill impairment triggering evaluation. Goodwill impairment guidance requires entities to evaluate if the fair value of a reporting entity (that possesses goodwill) is less than its carrying value. Under guidance prior to this ASU, if it were deemed that it was more likely than not that goodwill was impaired, goodwill was tested for impairment using the triggering event date as the measurement date.

Several concerns regarding triggering event evaluations were raised by certain entities, specifically that the cost and complexity to evaluate interim triggering events was burdensome and operationally many private entities likely only evaluate impairment at the end of a reporting period. With these circumstances, the ASU referenced that it may be unduly difficult for these entities to determine a specific triggering date or even identify that a triggering event had occurred. Additionally, the temporary variability in values as a result of the COVID-19 pandemic likely exacerbated this issue.

Accordingly, the amendments in this ASU allow an accounting alternative to perform a goodwill impairment triggering event evaluation only as of the end of a reporting period, regardless of if that is an interim or an annual period. If an entity elects this alternative, they will only evaluate goodwill for impairment as of each reporting date. As a key note, this election is permitted for private and not-for-profit entities regardless of which U.S. GAAP accounting treatment was elected for goodwill (i.e., impairment only or straight-line amortization).

Existing Authoritative Literature:

Staff note – while the calculation of goodwill differs between U.S. GAAP and Statutory Accounting, the foundation of goodwill is similar. For completeness of this document, applicable goodwill references, as well as impairment guidance, have been included herein. Certain relevant items have been bolded for emphasis.

SSAP No. 68—Business Combinations and Goodwill

Statutory Purchases of SCA Investments

3. The statutory purchase method of accounting is defined as accounting for a business combination as the acquisition of one entity by another. It shall be used for all purchases of SCA entities including partnerships, joint ventures, and limited liability companies. The acquiring reporting entity shall record its investment at cost. Cost is defined as the sum of: (a) any cash payment, (b) the fair value of other assets distributed, (c) the fair value of any liabilities assumed, and (d) any direct costs of the acquisition.^(INT 00-28) Contingent consideration issued in a purchase business combination that is embedded in a security or that is in the form of a separate financial instrument shall be recorded by the issuer at fair value at the acquisition date.

4. **For those acquired SCA entities accounted for in accordance with paragraphs 8.b.i., 8.b.ii., 8.b.iii. or 8.b.iv. of SSAP No. 97, and joint venture, partnership or limited liability company entities accounted for in accordance with paragraph 8 of SSAP No. 48, goodwill is defined as the difference between the cost of acquiring the entity and the reporting entity's share of the book value of the acquired entity. When the cost of the acquired entity is greater than the reporting entity's share of the book value, positive goodwill exists.** When the cost of the acquired entity is less than the reporting entity's share of the book value, negative goodwill exists. Goodwill resulting from assumption reinsurance shall be recorded as a separate write-in for other-than-invested assets. All other goodwill shall be reported in the carrying value of the investment.

5. **A business combination accounted for under the statutory purchase method and in which the acquired entity is valued in accordance with paragraphs 8.b.ii., 8.b.iii. or, 8.b.iv. of SSAP No. 97 shall determine the amount of positive goodwill or negative goodwill created by the combination using the reporting entity's share of the GAAP net book value of the acquired entity, adjusted to a statutory basis of accounting in accordance with paragraph 9 of SSAP No. 97 in the case of acquired entities valued in accordance paragraphs 8.b.ii. or 8.b.iv. of SSAP No. 97. Business combinations accounted for under the statutory purchase method and in which the acquired entity is valued in accordance with, paragraph 8.b.i. of SSAP No. 97 shall determine the amount of positive or negative goodwill created by the business combination using the insurer's share of the statutory book value of the acquired entity.**

6. For those acquired SCA entities accounted for in accordance with paragraph 8.b.i. of SSAP No. 97 under the statutory purchase method, the historical bases of the acquired entity shall continue to be used in preparing its statutory financial statements. Therefore, pushdown accounting is not permitted.

7. Positive goodwill recorded under the statutory purchase method of accounting shall be admitted subject to the following limitation: Positive goodwill from all sources, including life, accident and health, and deposit-type assumption reinsurance and goodwill resulting from the acquisition of an SCA by the insurance reporting entity that is reported on the SCA's financial statements (resulting from the application of pushdown accounting), is limited in the aggregate to 10% of the acquiring entity's capital and surplus as required to be shown on the statutory balance sheet of the reporting entity for its most recently filed statement with the domiciliary state commissioner adjusted to exclude any net positive goodwill, EDP equipment and operating system software, and net deferred tax assets. Additionally, all positive goodwill shall be nonadmitted when the underlying investment in the SCA or partnership, joint venture and limited liability company is nonadmitted. When negative goodwill exists, it shall be recorded as a contra-asset.

8. Positive or negative goodwill resulting from the purchase of an SCA, joint venture, partnership or limited liability company shall be amortized to unrealized capital gains and losses on investments over the period in which the acquiring entity benefits economically, not to exceed 10 years. Positive or negative goodwill resulting from life, accident and health, and deposit-type assumption reinsurance shall be amortized to operations as a component of general insurance expenses over the period in which the assuming entity benefits economically, not to exceed 10 years. Goodwill shall be evaluated separately for each transaction.^(INT 01-18)

Impairment

9. **For any decline in the fair value of an entity, acquired through a purchase, that is other than temporary^(INT 06-07), the investment shall be written down to fair value as the new cost basis and the amount of the write down shall be accounted for as a realized loss.** The write down shall first be considered as an adjustment to any portion of the investment that is nonadmitted (e.g., nonadmitted goodwill). The new cost basis shall not be changed for subsequent recoveries in fair value. Future declines in fair value, which are determined to be other than temporary, shall be recorded as realized losses. A long-lived asset shall be tested for recoverability whenever events or changes in circumstances indicate that its carrying amount may not be recoverable. The following are examples of such triggering events or changes in circumstances:

- a. A significant decrease in the fair value of a long-lived asset

- b. A significant adverse change in the extent or manner in which a long-lived asset is being used or in its physical condition
 - c. A significant adverse change in legal factors or in the business climate that could affect the value of a long-lived asset, including an adverse action or assessment by a regulator
 - d. An accumulation of costs significantly in excess of the amount originally expected for the acquisition or construction of a long-lived asset
 - e. A current period operating or cash flow loss combined with a history of operating or cash flow losses or a projection or forecast that demonstrates continuing losses associated with the use of a long-lived asset
 - f. A current expectation that, more likely than not, a long-lived asset will be sold or otherwise disposed of significantly before the end of its previously estimated useful life
10. **An impairment shall be considered to have occurred if it is probable that the reporting entity will be unable to recover the carrying amount of the investment or there is evidence indicating inability of the investee to sustain earnings which would justify the carrying amount of the investment.** A fair value of an investment that is below the carrying amount based on the statutory equity method or the existence of investee operating losses may indicate a loss in value; however, they are not necessarily indicative of a loss in value that is other than temporary.

Staff note: In addition to the guidance in SSAP No. 68, *INT 06-07: Definition of Phrase “Other Than Temporary”* also provides authoritative guidance for when an impairment has occurred. While INT 06-07 has been included below, with certain relevant items bolded for emphasis, the requirement for impairment is an assessment - if an impairment indicator is present. Thus, it does not permit the delaying of an impairment assessment until a reporting period, nor does it permit assessment differentiation based on entity type (public vs. private or a not-for-profit entity).

INT 06-07: Definition of Phrase “Other than Temporary”

1. The *Accounting Practices and Procedures Manual* contains guidance for determining when an investment is considered impaired within each of the above identified statements. Those statements should also be used to determine the measurement of an impairment loss. Each of the above statements also makes reference to an “other than temporary” decline in fair value. This interpretation is designed to address questions related to that phrase, as well as summarize the statutory accounting process for determining when an investment is considered impaired.

Step 1: Determine Whether an Investment Is Impaired

2. The decision for determining when an investment is considered impaired is dictated by the applicable SSAP and the respective impairment indicators included in each of the SSAPs. **If an impairment indicator is present, the determination of an impairment shall be assessed at the individual security or investment level as reported in the annual statement and supporting schedules.** For those SSAPs that require the reporting entity to use the fair value to determine if an impairment has occurred, the determination of that value shall be consistent with how the term fair value is defined within *SSAP No. 100—Fair Value*. Once a reporting entity has determined that an impairment indicator is present, the reporting entity shall continue to evaluate whether the investment is impaired each subsequent reporting period until either (a) the investment experiences a recovery of the fair value up to (or beyond) its carrying value or (b) the investor recognizes an other-than-temporary impairment loss.

Step 2: Evaluate Whether an Impairment Is Other Than Temporary

3. **There are numerous factors to be considered when determining whether an impairment is other than temporary and their relative significance will vary from case to case.** The Emerging Accounting Issues (E) Working Group (Working Group) has been asked if the phrase “other than temporary” should be interpreted to mean “permanent.” The Working Group believes the Statutory Accounting Principles (E) Working Group consciously chose the phrase “other than temporary” as the analysis was not

intended to determine whether an individual security or investment was “permanently impaired.” **The fair value of assets may decline for various reasons. The market price may be affected by general market conditions, which reflect prospects for the economy as a whole, or by specific information pertaining to an industry or an individual company. Such declines require further investigation by management. Acting upon the premise that a write-down may be required, management should consider all available evidence to evaluate the fair value of its investment.**

4. **The Working Group believes that the following items are only a few examples of the factors, which, individually or in combination, indicate that a security’s decline in value is specific to an issuer’s fundamental credit difficulties, or that a non-interest related decline is other than temporary and that a write-down of the carrying value is required:**

- a. **The length of time and the extent to which the fair value has been less than cost;**
- b. **The financial condition and short-term prospects of the issuer, including any specific events that may influence the operations of the issuer, such as changes in technology, that may impair the earnings potential of the asset or the discontinuance of a segment of the business that may affect the future earnings potential; or**
- c. **The intent and ability of the holder to retain its investment in the issuer for a period of time sufficient to allow for any anticipated recovery in value.**

5. **An interest related impairment should be deemed other-than-temporary when an investor has the intent to sell an investment, at the reporting date, before recovery of the cost of the investment.** The investor should consider whether its cash or working capital requirements and contractual or regulatory obligations indicate that the investment may need to be sold before the forecasted recovery occurs. The term “interest related” includes a declining value due to both increases in the risk free interest rate and general credit spread widening. Credit spreads can widen or contract for a variety of reasons, including supply/demand imbalances in the marketplace or perceived higher/lower risk of an entire sector. If the declining value is caused, in whole or in part, due to credit spreads widening, but not due to fundamental credit problems of the issuer, the change in credit spreads is deemed to be interest related. Fundamental credit problems exist with the issuer when there is evidence of financial difficulty that may result in the issuer being unable to pay principal or interest when due.

6. **Unless evidence exists to support the assertion that the decline in fair value below carrying value is temporary, a write-down, accounted for as a realized loss, should be recorded.** In accordance with the guidance of the SSAPs, such loss should be recognized in income for the period in which other than temporary impairment is determined to have occurred. The adjusted carrying value reflecting the impairment loss of the individual security or investment shall be the new cost basis of the individual security or investment.

7. The Working Group has also been asked if it is appropriate for reporting entities, independent auditors or state examiners to apply predefined thresholds to the phrase “other than temporary”? The Working Group is aware that certain insurers, independent auditors and state examiners, over time, have developed quantitative thresholds as “rules of thumb” to assist in the evaluation of asset impairment. One rule of thumb in particular suggests that if the fair value is less than its carrying value by 20 percent or more, then it is considered to be other than temporarily impaired. Another suggests that an asset is other than temporarily impaired if the fair value has been less than cost for more than 6 months. The use of a numerical threshold may provide the basis for a preliminary assumption that – without considering all relevant circumstances – an impairment may have occurred. Identifying the impairment is only the beginning of the analysis; it cannot appropriately be used as a substitute for a full analysis of all relevant qualitative considerations. Exclusive reliance on such thresholds removes the ability of management to apply its judgment, a concept inherent to the impairment model.

Step 3: If the Impairment is Other Than Temporary, the Cost Basis of the Individual Asset Shall Be Written Down to a New Cost Basis and the Amount of the Write-Down Is Accounted for as a Realized Loss

8. If an impairment is considered other than temporary, the cost or carrying value of the asset should be written down to reflect its value in accordance with the relevant SSAP. A company's management should follow the impairment guidance in the SSAP pertaining to that particular asset class while considering various factors on a case-by-case basis in determining the amount of the realized loss that should be recorded.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups): None

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group: None

Convergence with International Financial Reporting Standards (IFRS): Not applicable – *IAS 36 Impairment of Assets*, requires an annual assessment of the impairment for goodwill.

Staff Recommendation:

NAIC staff recommends that the Working Group move this item to the active listing, categorized as nonsubstantive and expose revisions to *SSAP No. 68—Business Combinations and Goodwill* to reject *ASU 2021-03, Intangibles – Goodwill and Other (Topic 350) – Accounting Alternative for Evaluating Triggering Events for statutory accounting*. Rejecting this ASU will result with continuation of existing guidance from INT 06-07, which does not permit delays in impairment assessment or variations in assessment based on type of entity.

Proposed revisions to SSAP No. 68 (Relevant Literature section – paragraph 22):

22. This statement rejects [ASU 2021-03, Intangibles – Goodwill and Other – Accounting Alternative for Evaluating triggering Events](#), [ASU 2019-06, Intangibles—Goodwill and Other Business Combinations, and Non-for-Profit Entities](#), [ASU 2017-04, Simplifying the Test for Goodwill Impairment](#), [ASU 2016-03, Intangibles—Goodwill and Other, Business Combinations, Consolidation, Derivatives and Hedging](#); [ASU 2014-02, Accounting for Goodwill \(a consensus of the Private Company Council\)](#), [ASU 2012-02, Testing Indefinite-Lived Intangible Assets for Impairment](#), [ASU 2011-08, Testing Goodwill for Impairment](#) and [ASU 2010-28, When to Perform Step 2 of the Goodwill Impairment Test for Reporting Units with Zero or Negative Carrying Amounts](#); [Accounting Principles Board Opinion No. 16, Business Combinations](#); [FASB Statement No. 38, Accounting for Preacquisition Contingencies of Purchased Enterprises, an amendment of APB Opinion No. 16](#); [Accounting Principles Board Opinion No. 17, Intangible Assets](#); [FASB Statement No. 79, Elimination of Certain Disclosures for Business Combinations by Nonpublic Enterprises](#); [FASB Statement No. 141, Business Combinations](#); and [FASB Statement No. 142, Goodwill and Other Intangible Assets](#).

Staff Review Completed by: Jim Pinegar, NAIC Staff – October 2021

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this item to the active listing, categorized as nonsubstantive, and exposed revisions to *SSAP No. 68—Business Combinations and Goodwill* to reject *ASU 2021-03, Intangibles – Goodwill and Other (Topic 350) – Accounting Alternative for Evaluating Triggering Events* for statutory accounting.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted, as final, the exposed revisions, as illustrated above, to *SSAP No. 68—Business Combinations and Goodwill* rejecting *ASU 2021-03, Intangibles – Goodwill and Other (Topic 350) – Accounting Alternative for Evaluating Triggering Events* for statutory accounting.

Issue: ASU 2021-05, Leases (Topic 842), Lessors—Certain Leases with Variable Lease Payments

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue: In July 2021, the Financial Accounting Standards Board (FASB) issued *Accounting Standard Update (ASU) 2021-05, Leases (Topic 842), Lessors—Certain Leases with Variable Lease Payments*. This ASU was issued as part of FASB’s post-implementation review to address issues that have been found during the implementation of the new lease guidance from *ASU 2016-02, Leases (Topic 842)*. The guidance in ASU 2021-05 applies to lessors with lease contracts that: 1) have variable lease payments that do not depend on a reference index or rate, and/or 2) would have resulted in the lessor being required to recognize a day one selling loss (at lease commencement) if those leases were classified as sales-type or direct financing. The changes to Topic 842 will require a lessor to classify a lease with variable lease payments that do not depend on an index or a rate as an operating lease at lease commencement if classifying the lease as a sales-type lease or a direct financing lease would result in the recognition of a selling loss. *SSAP No. 22R—Leases* requires nearly all leases to be treated as operating leases for statutory accounting, so adoption of this guidance would be redundant and unnecessary.

Existing Authoritative Literature:

The ASUs related to Topic 842 have previously been rejected in *SSAP No. 22R—Leases*.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups): None

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group: None

Convergence with International Financial Reporting Standards (IFRS): ASC Topic 842 was the result of a joint project between FASB and the International Accounting Standards Board.

Recommendation: Staff recommends the Working Group move this agenda item to the active listing, categorized as nonsubstantive and expose revisions to reject ASU 2021-05 in *SSAP No. 22R—Leases*. Under statutory accounting almost all leases are classified as operating leases, thus this U.S. GAAP guidance is not necessary.

Proposed Revision to SSAP No. 22R (Relevant Literature section – paragraph 52):

- i. [ASU 2020-02, Leases \(Topic 842\), Lessors—Certain Leases with Variable Lease Payments \(Rejected in its entirety.\)](#)

Staff Review Completed by: Jake Stultz, NAIC Staff – August 2021

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this agenda item to the active listing, categorized as nonsubstantive, and exposed revisions to reject ASU 2021-05 in SSAP No. 22R.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted, as final, the exposed revisions, as illustrated above, to reject *ASU 2021-05, Leases (Topic 842), Lessors—Certain Leases with Variable Lease Payments* in *SSAP No. 22R—Leases*.

Issue: *ASU 2021-06—Amendments to SEC Paragraphs in Topic 205, Topic 942 and Topic 946*

Check (applicable entity):

	P/C	Life	Health
Modification of Existing SSAP	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
New Issue or SSAP	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Interpretation	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Description of Issue:

The Financial Accounting Standards Board issued *Accounting Standard Update (ASU) 2021-06, Presentation of Financial Statements (Topic 205), Financial Services—Depository and Lending (Topic 942), and Financial Services— Investment Companies (Topic 946), Amendments to SEC Paragraphs Pursuant to SEC Final Rule Releases No. 33-10786, Amendments to Financial Disclosures about Acquired and Disposed Businesses, and No. 33-10835, Update of Statistical Disclosures for Bank and Savings and Loan Registrants*, which effects only SEC paragraphs in Topic 205, Topic 942 and Topic 946. These edits are predominantly formatting and paragraph references, with new guidance duplicated from SEC requirements on the presentation of financial statements for funds acquired or to be acquired.

Existing Authoritative Literature:

Generally, all SEC guidance from ASUs is rejected as not applicable for statutory accounting in *Appendix D—Nonapplicable GAAP Pronouncements*.

Activity to Date (issues previously addressed by the Working Group, Emerging Accounting Issues (E) Working Group, SEC, FASB, other State Departments of Insurance or other NAIC groups): None

Information or issues (included in *Description of Issue*) not previously contemplated by the Working Group: None

Convergence with International Financial Reporting Standards (IFRS): None

Staff Recommendation: NAIC staff recommends that the Working Group move this item to the active listing, categorized as nonsubstantive, and expose revisions to *Appendix D—Nonapplicable GAAP Pronouncements* to reject *ASU 2021-06, Presentation of Financial Statements (Topic 205), Financial Services—Depository and Lending (Topic 942), and Financial Services— Investment Companies (Topic 946), Amendments to SEC Paragraphs Pursuant to SEC Final Rule Releases No. 33-10786, Amendments to Financial Disclosures about Acquired and Disposed Businesses, and No. 33-10835, Update of Statistical Disclosures for Bank and Savings and Loan Registrants* as not applicable to statutory accounting.

This item is proposed to be rejected as not applicable as ASU 2021-06 is specific to deletion and modification of SEC paragraphs, which are not applicable for statutory accounting purposes.

Staff Review Completed by: Jake Stultz, November 2021

Status:

On December 11, 2021, the Statutory Accounting Principles (E) Working Group moved this item to the active listing, categorized as nonsubstantive, and exposed revisions to *Appendix D—Nonapplicable GAAP Pronouncements* to reject ASU 2021-06 as not applicable to statutory accounting.

On April 4, 2022, the Statutory Accounting Principles (E) Working Group adopted, as final, the exposed revisions to *Appendix D—Nonapplicable GAAP Pronouncements* to reject ASU 2021-06 as not applicable to statutory accounting.

Not for Distribution

The National Association of Insurance Commissioners (NAIC) is the U.S. standard-setting and regulatory support organization created and governed by the chief insurance regulators from the 50 states, the District of Columbia and five U.S. territories. Through the NAIC, state insurance regulators establish standards and best practices, conduct peer review, and coordinate their regulatory oversight. NAIC staff supports these efforts and represents the collective views of state regulators domestically and internationally. NAIC members, together with the central resources of the NAIC, form the national system of state-based insurance regulation in the U.S.

For more information, visit www.naic.org.
